Dave,
Used to run packet in St. Marys but it died several years ago due to
internet. Suggest you get in touch with some of the guys on local repeater.
Also St. Marys has a repeater with a nice group of guys and they might be
able to help. Presently living in Charleston, SC

For DCF-77 (77.5 KHz), which uses the same modulation (although I think
with fewer dB of reduction), special ICs exist that do everything with only
a ceramic resonator and an antenna (ferrite rod) attached. Serial digital
stream comes out of it, ready to be decoded by a resident program.

This can be found in the $10 alarm clocks I mentioned.

Can't you find something similar in the US?

Rob

It looks like most of the WWVB radio clocks, in fact, use 60KHz modules from - or copied from - Germany's Juergans. Some of them do not work well here in Florida, though, because of the distance to Fort Collins, Colorado, the transmitter location. For our office, I built a 60KHz oscillator, driven by a PC that produces the timecode, to keep a wall of radio clocks in sync and on time.

Still looking for the 'perfect' trade on this! Thanks to all who have made offers! I am still considering them!!

Greetings! Up for grabs is an immaculate (I mean TRULY immaculate) Kenwood TS-850SAT. This one didn't look any better when it came out of the box from the factory! I cannot find a scratch, fault, or blemish anywhere on this rig! If you are a Kenwood fan, you already know the features of this competition class, world renowned transceiver! And this one is LOADED with the YK-88C-1 filter, the YG-455C-1 CW Crystal Filter, the VRU-2 Digital Voice Recorder unit, the VS-2 Voice Synthesizer Unit, and the Kenwood IF-232C Computer Interface with all cabling! Also includes the original stock microphone and box in MINT condition! Only thing that shows any wear on this outfit is the manual, and it's not in bad shape at all...schematics included. If you can find a cleaner TS-850SAT out there anywhere, I'll eat my shorts, Hi Hi!!! I would prefer someone within driving/meeting distance on this one, so you can appreciate the true beauty of this one! For those of you not familiar, the Kenwood TS-850SAT is called by many one of the best HF rigs ever manufactured! It CERTAINLY has one of the best receivers of any rig! Includes 160-10 meters (WARC included) with general coverage receiver. Features a great automatic antenna tuner, dual VFO's, dual NB, slope tuning, adjustable AGC, memory 'channels', I could go on and on...look at the product reviews section on www.eham.net for further comments on this great rig! I am really looking to trade this rig...would like at least a KW amplifier with a lower-end rig...something along the lines of an SB-220 in excellent condition with an older rig would suffice. I'll listen to any and all offers. Don't be afraid to bounce an idea off of me! I would also prefer that the deal be completed in person. Anyone in the Chicago or Rockford, IL area interested? How about the Madison or Milwaukee, WI area? E-mail me with any and all offers! Sorry for the length of this post! I don't usually get this wordy but this one's a true beauty! 73 es gud dx de N9LXX~~~ R. Blaine Fox

Hello
A newer version of DXPSK is now available
-ADIF logging capability added
-(Bandwidth bug corrected)
This is the version 1.7c
http://members.aol.com/chramade/dxpsk.htm
And it is FREE...
Enjoy!

Thanks to
all. I spoke before i thought. If 12 A/D, dymanic range is 20log(2^12), right? Therefore noise floor of input signal should be below that, right? Also, I have to get a number of samples, FFT them and see that 2nd and 3rd harmonics are lower that 74dbc, meaning input signal has to be at least that good, right? The teat station I'm looking at uses a source with harmonics rated <30bdc, but then they BP filter the heck out of it.

Look into the 'WinLink' and 'AirMail' web pages. They do connect the

Internet to the Ham Bands in several ways. I have only used it for HF Pactor
to send/receive E-mail through the Internet. The speeds are too slow for
High Speed work. Look into it, however, and, perhaps, they support Packet
VHF at higher speeds.

Hi all,

Can anyone give me some feedback on the Ricoh RDC-6000? I live in South Africa and want to purchase this camera from the US. It will be delivered to my family over there who will bring it to me. What I would like to know is this - the camera has a AC adaptor for charging the battery. In South Africa we work on a 220V system and I think the US uses 110V. Will I be able to use the AC adaptor without any troubles?

Many thanks.

Try www.shareware.com

Lan-Link is what I run on my PK-232 (when I'm not running APRS)

Is anyone using a Tandy WP-2 on packet?

I can get it to talk to a KPC-3, but can�t save RX text like a Model
100/102.

Any ideas? Thanks!

Hi,

Has anyone successfully communicated with their VC-H1 via the
COM port on it? According to the manual (p 17-18), it is
possible to connect a computer to it via the serial port and
then remote control becomes possible. Kenwood provides pinouts
for the COM port in a file called connectors.pdf that is available
for download at www.kenwood.net.

Using the Kenwood document, I constructed a cable to connect my

VC-H1 to my computer. I set the communications parameters as
specified on p. 17 of the user manual (9600,8,1,no parity).
Other than turning on the LCD screen on the VC-H1, I am not
able to get any response from the camera when sending any of
the commands listed on p. 18 of the manual to the camera from a
terminal emulator. I've tried uppercase and lowercase and varying
the communications parameters, but to no avail.

I've also talked to Kenwood support in California and they don't
seem to have a clue. Their support person still hasn't called me
back as promised after 48 hours have gone by. Unfortunately, I
don't speak Japanese or I'd call the company in Japan and cut the
fools in California out of the loop.

I have used it with the PK-232 no problem. Make sure that you have
the right baud rate set in the program. Try turning off any
transceiver control options in the software that may be turned on.
Try e-mailing Gary; he is very helpful. RJB.

Hello,

I am wanting to get some good packet software. I have a kenwood TH-D7a and a
old dos based computer. Can someone tell me what software i need for packet
radio and where to get it. Any help would be greatly appreciated.

Thanks....

You didn't say what kind of computer it was. If you can load Windows
3.1 on it, Windows 3.1 comes with a terminal program - and that will be
good enough to get you started.

I'm sure there are old DOS-based programs out there that will work.
But good luck finding them.

Psssst.... Let me let you in on a little secret - nobody, and I mean NOBODY, uses DOS anymore. If you insist on trying to use that old clunker(again, you didn't say what it was - so I have to assume it is a real clunker - like an XT, or something!), you are not going to get any sympathy from anyone.

If you've got at least a 486 with 16Mb of memory, there is at least hope for the thing - you can put Linux on it! RedHat Linux 6.1, loaded in text-only mode, works great on a 486 with 16Mb! Since most schools won't even bother taking any donated computers that are lower than a Pentium with 32Mb - you should be able to pick up a 486 for about $25, and run Win95 or Linux on it. Do the world a favor - SHIT CAN anything lower than a 486 with 16Mb of memory.

Actually i have a few computers, the reason that i wanted to use the dos machine is because i dont have any other use for it. It is a 386 and i did put 16MB of memory in it a few years back. I have a 486 that has windows 3.1 installed, how would I use that for packet?

Thanks

I have used XPWin with PK-232, but I recall that some very old
firmware versions of the PK-232 are a problem.

I really like XPWare programs.

Thanks for all the suggestions regarding XPWare ver 1.28 software. I have concluded the software has problems with the AEA interface. I have tried every possible combination of comm ports, baud rate, data bits, parity and stop bits all to no avail. Have spent hours trying to get the software to communicate with my PK-232MBX running version 7.00 firmware. Even attempted to load a run on a second computer and had no luck on that system either. My computers worked just fine with other multi mode communication software and my PK232. My advise to all people thinking of trying XPWare is not to waste your time with this package.
Tnx, Bob AA8X

Or you could not waste your time with a PK-232.

XPWare works a treat with my PTC-IIe. I like it.

Send me a copy of the XPWIN.INI file in your windows directory
and I will take a look. XPWIN was orginally written for the PK232 and
works fine with my PK232 and PK900's here on the desk.

Sounds like the parity is set to 7 bits and even parity. Should be 8
data bits 1 stop bits and Parity set to None. Any other setting will
NOT work. Use at least 4800 baud.

73 Gary KF7XP

I dont think there should be any problem with
TS-440.
I think it has the 13 pin ACC2 socket on the rear.

Thats the way in and out.

If you need more info email me.
or see www.g3liv.co.uk
73es de johnny G3liv.

This is not the way you do these things under Linux!

Direct fiddling with I/O ports requires root privileges, allows the program to mess up the entire system, and is nonportable because of all the hardcoded addresses in the program.

Instead, use the TIOCMBIS and TIOCMBIT ioctls. (bit-set and bit-clear)
Example fragment:

```
#include <stdio.h>
#include <fcntl.h>
#include <termios.h>

{
        int fd,arg;
```

```
    char *portname = "/dev/ttyS0";   /* or whatever */

        if ((fd = open(portname,O_RDWR|O_NONBLOCK)) < 0)
        {
            perror(portname);
            exit(1);
        }

    arg = TIOCM_RTS;        /* or TIOCM_DTR */
    ioctl(fd,TIOCMBIS,&arg);    /* set the line */
    ioctl(fd,TIOCMBIC,&arg);    /* reset the line */
}
```

It would be portable to any x86 system. I don't know a Ham with a Sparc,
Alpha, or RS/6000, so I'm not concerned too much about architecture
portability :-)

I take note of your "mess up the entire system." I think by that, you mean
that a process could interfere with the port, and I am aware that the serial
port and parallel port must be dedicated on the controller. This 486
controller
will not do anything except control the repeater and process audio through
a soundcard and the ethernet.

I appreciate the fragment, and will play around with it. It's early yet, so
options are open. Are there also parallel port bits controlled using this
method?

It is possible to do it, but that does not mean it is the proper way to do it...

It would not work on my system either...   I have a plain Pentium system, but it has a 6-port serial card that brings the total number of COM ports to 8. These are perfectly accessible as ttyS0..ttyS7 after setting the port numbers one time in the system startup files.

```
/dev/ttyS0 at 0x03f8 (irq = 4) is a 16550A
/dev/ttyS1 at 0x02f8 (irq = 3) is a 16550A
/dev/ttyS2 at 0x0220 (irq = 15) is a 16550A
/dev/ttyS3 at 0x0228 (irq = 15) is a 16550A
/dev/ttyS4 at 0x03e8 (irq = 15) is a 16550A
/dev/ttyS5 at 0x02e8 (irq = 15) is a 16550A
/dev/ttyS6 at 0x03e0 (irq = 15) is a 16550A
/dev/ttyS7 at 0x02e0 (irq = 15) is a 16550A
```

Well, of course it will not mess up the system until you do something wrong. But that is exactly like the situation in Windows. The Linux kernel tries to protect you from doing things wrong, but it allows a cut through in case you really need it. You are using this cut through the protection, but it is not required in that case.

I am using the ttyS6 from the above list for several purposes:

RXD/DCD lines connected to a timestandard receiver (DCF77)
DSR line used as a one-bit input from a motion detector (burglar alarm)
RTS/DTR lines used to shift data into a rotor controller (AMSAT-DL)
TXD line used to control a circuit that drives a coaxial input selector
    in front of my R7100

These lines are driven and sensed by 4 separate programs. No problem when using the ioctls, but I would not dare to do that using direct port access.

The programs are running as a nonprivileged user, just to a chown of the tty device to the user you want to run the program (or a chmod a+rw). No need for root privileges.

>> Instead, use the TIOCMBIS and TIOCMBIT ioctls. (bit-set and bit-clear)
>> Example fragment:

>I appreciate the fragment, and will play around with it. It's early yet, so

I am not an expert on parallel ports, as I use my single parallel port to drive my printer. All my stuff is hanging off serial ports.

It looks like (nice to have the kernel source!) there is no ioctl to manipulate printer port bits. What you could do is wire the port in such a way that the kernel considers it "ready" (some fixed levels on status bits and probably a wire from the strobe to the ack, maybe needs an inverter). Then, you can just open the /dev/lp0 for writing, and writing a single byte will put it on the 8 datalines.

I am looking into setting up a packet station in Brunswick, Georgia.

I have a TR-7950 Kenwood 50 watt transceiver, AEA PK88 TNC and AEA Isopole antenna that I can dedicate to the station. Is there any current activity in this area, and could a link here fill any gaps to help build or restore a network.

I don't have a much packet experience, but have a good understanding of DOS based BBS operation, having run a multinode DOS BBS with up to 250 users on a 5 computer network using 4 dial-up lines for incoming connections.

I could also consider APRS instead. Again, need for a link or node to expand communications in the South East would be my main criteria.

If there is no need, I could still enjoy recreational usage, but don't mind trying to maintain a node or link if it would be beneficial.

Info and direction requested.....

David Little

Yes, this looks reasonable. Note that in situations where you want to manipulate individual lines from several programs it is better to use the newer TIOCMBIC/TIOCMBIS commands than the TIOCMGET/TIOCMSET used in the example.

I have no manual but I do have a schematic.  There are many jumpers, it
seems best not to touch them.  Most are for very specialized purposes.

The DIP switch is used as follows:

1&2 select the base address  (4 possible combinations)
3-8 select the IRQ (set only 1 switch to ON for IRQ 9,3,4,5,6,7 resp)

Xref: supernews.google.com rec.radio.amateur.digital.misc:1477

My name is Randy, K0CM, and I was an early adopter of packet in 1985. I ran packet BBS's and set up digi's and nodes. When I started, my phone modem was 300 bps and VHF packet wasd 1200 bps.

My phone modem has gone from 300, to 1200, to 2400 to 9600 to 19,200 to 28.8 to 56K and now I'm using a cable modem that averages 700 kbps.

As far as I know there is no high speed packet in my area. Despite a few attempts at 9600 bps (I wired up three K9NG modems), and someone trying a Kantronics dataradio, we just neve got moving.

I've recently been reading about IEEE 802.11b (DSSS) 2.4GHz links.

These have evolved into something that I had hoped packet radio would have done. Cost is currently under $300 per unit. (Less than most radio - TNC combinations).

Is there any way to adapt these units to ham radio use? Could we modify the RF to go to another band, and raise the power or use directional antennas?

These things are reported to have a range in the hundreds of yards. The top data rate is 11 Mbps.

Would it be possible to build an intercity backbone with a set of modified 802.11b devices?

These use the 2.4 Ghz ISM band and use Direct Sequence Spread Sprectrum techniques.

Here are some manufacturers links:

http://www.linksys.com/products/product.asp?prid=157&grid=19

http://www.3com.com/mobile/wireless/index.html

http://www.dlink.com/products/wireless/

I got out of packet radio because it was just too slow to do anything useful. Speed like this could get me interested again.

73, Randy - K0CM

Springfield, MO

Oh Yes, I forgot to add that many HAMs do NOT even use a PTT circuit. They
just use VOX. VOX works great on almost all the digital modes (except for
PACTOR and packet)

All you need are two audio cables, a couple of audio isolation transfomers
from Radio Shack and a resistor!

73

Pactor and AX.25 are obsolete. Get over it.

So, in other words, you haven't heard of "2.5G" and "3G". Hint: I'm
not talking about frequency bands here.

Do you *really* mean to say that 900MHz+ is useless for wide-area
networking? Do you *really* believe this?

> HF is for the birds.

HF is not really the right choice for wide-area data networks.

I'll just assume that you don't actually know about RIM, Mobitex, i-mode,
CDMA or anything else relevant. Am I mistaken?

> Besides, all this stuff costs money. There is a recession coming, and

Ah. Now we're getting to the bottom of your "vision". Wireless data
services very cheaply.

How are applications and infrastructure created for free? Are you going to develop and deploy it out of the goodness of your heart?

How is the infrastructure operated for free?

> > How do you propose to pay for "RF Internet Gateways" in the MURS

So, $150 gets a radio and a TNC (which, by the way, aren't really suitable for your PDA users). How much does the broadband connection cost? Are you suggesting that people will voluntarily ante up their broadband connection to wireless freeloaders? Never mind that this is likely to some people kicked off of their broadband connections (ever read the terms of service on these things?) and I'm not all that sure that the NetZero service is easy to gateway.

Again, would please explain how this is all paid for?

> > I think you're making a lot of noise about essentially nothing.
>
> and you aren't?

Nope. Do you know about Ricochet ? Do you know about PocketNet?

I'm not making noise about essentially nothing. You can sign up for RIM Blackberry service today, it's well-deployed in the USA. You can sign up for a number of commercially-supported data services that already exceed the 1200baud half-dupled throughput you propose.

My GSM phone works in the USA, Europe and Asia, and provides reliable 9600 baud data connection as well, and it fits in my shirt pocket. That's not at all like lugging an HT, a TNC, and a power supply around and hoping I'm near enough a volunteer network operator.

> > Happy Holidays, though!

New frequencies aren't necessarily required; existing 1900MHz PCS allocations are likely to be plenty of bandwidth, the issue is building out more network capacity (smaller cells).

2.5G - (GPRS) is already in deployment though it typically only
offers 20kbit/s as a matter of network bandwidth allocation.
It's early deployment, yes, but it is in deployment.

A friend in the radio site business recently remarked to me that all of the wireless operators are building out ten times the necessary radio site capacity at the moment. They're ready for data services...

Cheap is relative, and it is likely we'll see subsidized models of services.

At one time, cellular telephony was not cheap, and now it's like dirt, even with subsidized handsets.

Dana

Hmmmmmmmm. Well said.

Some people just love paying monthly charges for things like cell phone that don't work well. I don't care to promote robber-barons myself. To each his own. I just wish that was understood by all in here.

Like I said. We should be able to put forth ideas with out CONDEMING negitive and useless comment. Try to say your point without being destructive people.

What's interesting is the volume of posts here suggest were on to something. People have to be on board when it comes to communication.

In article <SLN06.63930$x6.29340733@news2.rdc2.tx.home.com>,

That use would be a violation of the NetZero TOS.
In fact, it would violate the TOS or AUP of almost all ISPs.
The exception: the reseller based ISPs. Plenty of them, but
the cost is not cheap for the number of users this "hyperMURS"
would need to service.

But why is this crap in a Ham Radio newsgroup anyway?

Because Stewart keeps trying to drum up his brainchild in the
closest suitable forum he can find ?

However, the issue with TOS/AUP of ISPs applies to amateur
radio networking as well, so perhaps this isn't "crap".

[BTW - Had a great visit to the Santa Maria Valley yesterday, tasted
a couple of superb Pinot Noirs and an intriguing Cabernet Franc]

If the goal is to somehow push internet connections across
ham radio ... but why would anyone want to do that? It's silly.

Once i-mode is deployed (and I'm betting that will happen fairly
rapidly now ... note all the interesting merger/cross-licensing/etc.
activity going on) then the whole MURS thing is moot.

Sounds excellent!

Used up another bottle of my Lambert Bridge this week ...
... goes well with T-bone ... just about out now :-)

Agreed; but, at least it's relevant to amateur radio. I'm still
scratching my head what Stewart is talking about when he
says "text-mode applications". HDML/WAP is already available
and most folks are yawning. Stewart - if you're reading this,
please comment on what you know about WAP.

> Once i-mode is deployed (and I'm betting that will happen fairly

I think the MURS thing is already less than irrelevant, but you're right
that i-mode promises to have a huge impact on the American market.

I'm scratching my head at what to open tonight; seriously thinking
about having a delightful and cheap Bocce Rosso Sangiovese...

Dana

Well, you know, the usual text-mode internet protocols:
```

smtp, pop, http, et al. Why we don't use pop/smtp over PACTOR-II
has always been a mystery to me.

But I think he means "not suitable for pictures, sound, or video",
unlike ham radio where we Hams have been transmitting and
receiving those things for many many years, even on HF (grin).

Um. Yes. Is getting to be that time of evening :-)

White here. Probably local Chard ... Autumn Wind.
Friends daughter / son-in-law are growers near here, they just
bought out that little family winery, so this will be one of the
last bottles under the old label.

I'm having a tuna-fish sandwich and a bottle of ripple.
Pretty good stuff, vintage wine made in September of 2000...

Where did you find August Wind outside the Chahalem Valley?
Or have you been to Dundee?

Press Release

PacTerm '98 and PKTerm '99 version 1.5 Preview released
Muscle Shoals, Alabama. December 22, 2000: Creative Services Software has announced that they have released PacTerm '98 and PKTerm '99 version 1.5 in Preview. This latest update supports the hot new digital mode PSK-31 as well as the AGW Packet Engine. This is the first product to integrate DSP sound card technology in conjunction with TNC technology. This release is a FREE upgrade for owners of the current product and users who purchase the product today.

The popular TNC program, written in C++, has been available since November 1997.

Company President Rick Ruhl, W4PC said, " We decided to release version 1.5 in Preview to allow the ham community start using PSK-31 with their TNCs, and to get input from them on challenges they find with the program. A Preview version of a product is a product that has gone through internal testing and some beta testing, but may still have some outstanding issues. Hams are pros when it comes to finding issues in a software product, and we welcome their findings".

New enhancements for version 1.5 include:

- PSK-31 sound card support, using the TNC's keying circuit or the TNC's serial port for keying the radio with RTS or DTR, saving a serial port for other functions!!!
- AGW Packet Engine for sound card packet support
- Voice DX spot announcements
- Support for 2 simultaneous TNCs (1 multimode and 1 packet)
- Point and click settings for TNC commands for startup
- Startup/Shutdown commands for each call sign
- 10 mode-specific macros in addition to 10 global macros for each call sign
- CQ, ID and QRT macros
- Pactor connected station call sign display in title bar
- 4K chat and macro buffer
- Support for Satellite Telemetry with the DSP-1232 and DSP-2232
- YAPP and PC-PakRatt binary file transfer support in Pactor or GTOR

And includes supports that the previous versions had:
� Macro Variables {CALL}, {UTCTIME} etc
� ASCII transfer for UNPROTO mode in Packet
� Multiple file select for ASCII transfers in HF
� Abort ASCII file transfer now available from HF
� Interoperability with Log Windows, DX4Win 4.06 and Logic 5 logging programs
� Basic radio control interface
� Added FIG/NUMS menu option in PKTerm
� Additional commands specific for the PK-900 and DSP-2232 in PKTerm
� Multi-stream multi-port support. Up to 26 streams per packet port, each in a different window
� Supports G-TOR� and G-TOR Monitoring (Kantronics)
� Switch between streams with a click of the mouse
� Text and binary file transfers with YAPP
� Supports COM1 to COM35 (including USB serial converters)
� User defined colors and fonts!
� User defined macros!
� Separate window for non packet HF modes, from CW through NavTex at the click of a mouse
� Save QSOs to a file that is compatible with Microsoft Word
� Multiple monitor windows allow you to watch traffic on each radio port

The program runs under Windows 95/98/Me and Windows NT/2000. It is a true 32-bit Windows application, designed using the Windows Style Guidelines available from Microsoft.

PacTerm '98 and PKTerm '99 are $79.95. They are available directly from Creative Services Software or your favorite dealer. You can also download the program in demo mode from the CSS web site.

Creative Services Software is at http://www.cssincorp.com.

Windows, Windows 95, Windows 98, Windows NT and Windows 2000 are Registered Trademarks of Microsoft Corporation.

Since the Amateur Service is so inappropriate and stifling for this new development and effort, why is it under discussion here on rec.radio.AMATEUR.digital.misc?

Wouldn't a new newsgroup unfettered with the Old Fart amateur service element be much more attuned to all this?

Who will take the lead?

72/73, George   W5YR - the Yellow Rose of Texas   NETXQRP 6

Fairview, TX   30 mi NE Dallas in Collin county   QRP-L 1373
Amateur Radio W5YR, in the 55th year and it just keeps getting better!

HF packet using 300 bps FSK might be obselete. Have you tried
Q15X25 AKA NEWQPSK though? OH2BNS has implemented an AX.25
soundcard modem for Linux which uses this modulation. Pretty cool.

Well if you want to get picky then this post of yours doesn't belong in this group. Who said it was a fight between MURS and ARS anyway. I'm looking for benefits. I love ARS and the benefits it does have. If it were not in need of new and more real world benefits then I wouldn't say anything.

We're all big boys and girls. Lets face facts. What does MURS have that ARS needs? If you're so proud of being an "Old Fart" then you know why you dislike the discussion. :)

So far were looking at digital modes to provide real benefits whether on ARS or MURS. Much ARS hardware can be used on MURS. Also maybe we can update ARS to specifically alow some HTTP.

Maybe we can get digital privileges on FRS so we can use good $20 FRS tranceivers. Maybe if we set up a FRS network the FCC would approve it. Once they got over the shock we Hams were actually doing something useful.

Can't we all just get along? LOL

How about a device that reads your email out loud in the car? One that lets you type back (when stopped). It seems to carry my criteria being of being cost-effective and benefical. Hey! Zero cents a minute. All incomming minutes free. No monthly fee.

Ideas people! That's what we need, brainstorming.

73

P.S. All great innovators meet with resistance. It is change that makes us uncomfortable for it shows the truth. We are not in control. God is. We don't know all there is to know. God does. Our will has limits in reality. God doesn't. Although, he does not change. Truth is not relative, we are. We just feel better with our false sense of reality. But that's OK. We will soon see. For better or worse.

Jesus is the risen Holy Spirit of God. He came to earth to pay for our stuborn self-will so we may know him and his love, joy, peace, patience, kindness, goodness, faithfulness, gentleness and self-control. Only the diety of Jesus paid for you to be with His good perfection and know his love and plan for your life. He is the perfect one. He only wants good for us. Therefore Jesus and not our own deeds are the *only* just payment for friendship with Him. He entends love in Christ. This life is our short time to accept His will over ours. Do you know His love and plan for your life?

Merry, merry Christmas,

Monthly charges? Cell phone that doesn't work well?

How far have you got behind in the US?

How do we pay for it.

We lose the "toll-bridge" idea and use the equipment we already have. A Pentuim or better computer with soundcard for $55 and up.

Make our own antennas. Design it so the always on home users participate in passing data. That way if the guy next door is down it goes next door. It could then be low power.

Get people on board with real communication benefits. Make it full-duplex.

Use $20 FRS rigs.

Make it as fast as commercial robber-barrons at no charge. Hey mabey we could put the crappy phone company out of business.

USE MODIFIED equipment. Like the wireless LANs for EXAMPLE. Use modified small mobile devices. perhaps PIC could help.

I don't know. Do you think it's possible to build somthing new? Why do you promote the staus quo? Could it have to do with your paycheck? Can't we state ideas whether right or wrong in order to synergize and get something happening?

How is Linux created for free?

Can you pass some of you vast knowlege about new systems and how they work or are you under a gag order? If you think in ARS are behind (we are) then why don't you help out?

The begining of knowlege is knowing you don't know everything. Next is knowing what you think you do know is limited in perspective. Third is knowing knowlege isn't everything and these apply to all mankind.

Merry Christmas.

I actually found that just after my last post.

A keygen would be nice, but that does the job.

Thanks.

K.

Hello Cathryn,

that Kenwood SSTV mode is not digital at all, only very fast and
bandwidth
hungry in FM analog. In Europe we are using 144,500 MHz mostly in FM for
SSTV analog...

Hey, thanks. I didn't know that.   Yeah, what we, US-ians need is something

like your 144.500 (Note period, not comma, hehe) channel for SSTV. I'm not sure
what 144.500 is used for the US. The bizarre and mostly useless ARRL
2m band plan shows 144.50-144.60 for 'Linear Translator inputs' and 144.30-
144.50 for OSCAR. Has anyone ever built a terrestrial linear translator on
2m?   So, I have no clue whether 144.50 would be available
in this country. Are there any satellites that use 144.30-144.50?

Are there any actual measurements on how much bandwidth the Kenwood-only
FM SSTV modes use? I've put out some feelers with the local guys here to
get a channel setup for SSTV on 430Mhz range. (NCPA mailing list on
qth.net) Will 20Khz spacing be enough?

That's just one part of the equation. How do you pay for the actual
network bandwidth as time goes on?

> Make our own antennas. Design it so the always on home users
> participate in passing data. That way if the guy next door is down it
> goes next door. It could then be low power.

Have you heard of Metricom Ricochet?

> Get people on board with real communication benefits. Make it full-
> duplex.

Why would you make it full-duplex?

> Use $20 FRS rigs.

Why? How does this actually help? The FRS radio alone is just
a narrow-band FM radio with no data capabilities. What do you use
for a modem?

> Make it as fast as commercial robber-barrons at no charge. Hey mabey
we
> could put the crappy phone company out of business.

How exactly do you plan to do this on the cheap?

> USE MODIFIED equipment. Like the wireless LANs for EXAMPLE. Use

Which modified small mobile devices? Who would do the modifications?
Would they do it for free?

> I don't know. Do you think it's possible to build somthing new? Why do
> you promote the staus quo? Could it have to do with your paycheck?
> Can't we state ideas whether right or wrong in order to synergize and
> get something happening?

Of course I think it is possible to build something new,that's
exactly what I've been talking about. You're welcome to state
ideas, obviously, and so am I. Stewart's idea for MURS-based
wide-area data service fails even the grossest sanity check, that's
my idea. Your suggestions fall short of even that. Put the phone
company out of business? Build a high-speed wide-area data network
for free?

Why do ask about my paycheck? Are you intent on impeaching my motives?
Here's a clue: mobile wireless data is already a large market. I'm
not making up names when I mention Research In Motion, Cingular,
NTT Docomo, GSM, Sprint, Palm.Net.

For starters, have a look at http://www.AnywhereYouGo.com/

I have no ulterior motives, I can just tell when I see a
half-baked idea, and that's just me freely sharing my own
opinion.

> How is Linux created for free?

Ah, the Open Source concept. It's not a business, it's a religion. Have you looked lately to see what's happened to the Linux-oriented businesses? The Linux/open source "movement" does not create a sustainable business model by itself; in the near term, Linux is being subsidized by large hardware manufacturers, but, in the longer term, everyone will wake up and realize that the emperor has no clothes. It's simple ludicrous to expect professional developers to give away the fruit of their labor forever.

> Can you pass some of you vast knowlege about new systems and how they work or are you under a gag order? If you think in ARS are behind (we are) then why don't you help out?

Gag order? Don't be silly. 2.5G and 3G are all the rage, as you'll find out if you invest even 5 minutes in a web search to educate yourself. AnywhereYouGo.com is an excellent jumping-off place. Have fun.

Here's how I'm helping out - I'm offering you a series of objective sanity checks completely for free: MURS is not the ARS, MURS will not support a wide-band deployment. Even Stewart promotes MURS as an alternative to ARS only to avoid content restriction and tap into lower-cost consumer equipment.

> The begining of knowlege is knowing you don't know everything. Next is knowing what you think you do know is limited in perspective. Third is knowing knowlege isn't everything and these apply to all mankind.

Forgive me, but it's stunningly ironic that you write this, apparently aimed at me.

I'm fairly aware of what I don't know, and I'm quite aware of the dangers of limited perspective, exactly what I was trying to help *you* with.

Something else: if you want to gain even a modicum of credibility, drop the anonymous Deja posting. Stand up and associate an identity with your words; I'm left thinking you're ashamed to associate your reputation with your ludicrous assertions, and I'm not surprised you seem to lash out at my motives when yours are hidden behind an anonymous identity.

> Merry Christmas.

... and a Happy 2001!

> BY THOSE THAT ARE IN THE KNOW!

Exactly where (frequency)? There isn't enough bandwidth in the 222-225 segment
without interfering with the other allowed modes (weak signal & repeaters). No
one has been permitted into the 219 segment due to intereference issues with
the primary licensee of that segment. If it is in fact being used, it's
certainly not coordinated (and for the 219 MHz segment, coordination is
required for the transmission to be legal).

> As far as me stating that the maximum speed on ARS as being 9.6Kbps -

> about 1.25cm.

Just because the fastest that anyone used in this area is 9600 doesn't mean
that 19.2 isn't allowed.

Since when?  Last time I checked, one still had to BUY the hardware on which to
run Linux as the OS.  There may not be a software cost, but there's still a
hardware cost.

Wake up and come back to reality.

A regression of software technology of wireless, non-commercial TCP/IP to KA9Q's original "net" program. Forget JNOS. Forget TNOS. Forget any graphical interface. He needs a platform whereby he can use his original 1981 IBM-PC, complete with 10 Mb hard drive and monochrome monitor.

(Or at least, that's the only thing that makes sense concerning Stewart.)

helpfull@my-deja.com wrote:

> P.S. All great innovators meet with resistance. It is change that makes
> us uncomfortable for it shows the truth.

1200 baud done with cobbled-together HTs *might* have been considered innovation in 1980. That was 20 years ago. Stewart's proposal is not innovative in any way. It is as simple as that. I'm not uncomfortable saying this at all.

Another truism is that "those that do not study history are doomed to repeat it". If you're interested in studying history relevant to wide-area digital communications, one place to look is http://www.etsi.org./

Sign up; download a bushel of the GSM specifications and figure out how to read them, then read them. Start with GSM 01.04, or at least keep it handy. Work through the existing deployment specs and then branch into 2.5G - GPRS - and the follow-on 3GPP specs, which are works in progress.

Understand what the professionals are doing before purporting to have a better solution.

This is cheap; ETSI makes these specs available for download without charge. There are books that demystify it all, but they cost money (argh! imagine that! people expecting value for their work!).

> We are not in control. God is.

Are you an anonymous evangelist? Now *that's* really courageous.

> We don't know all there is to know. God does.

If you value your witness, sign your name to it.

I wonder if Mr. Anonymous actually has a wireless telephone.

> Monthly charges? Cell phone that doesn't work well?

I'll bet Mr. Anonymous doesn't know about pre-paid wireless
service. I prefer to pay a monthly charge (versus pre-paid) because
I get more value that way.

Even my GSM phone finds service almost everywhere I travel inside
the US, and does even better outside the US ;-)

> How far have you got behind in the US?

The USA *is* "third-world" in terms of wireless communications, but it's not as bad as our anonymous friend would lead you to believe. We're actually quite innovative in terms of "flat-rate" billing plans, something that my European wireless operator friends would be happy to remain uniquely American.

My wife is quite happy with her single-band (USA) Nokia 5190, which was handed to her for "free", and the 1250 minutes of no-roaming, no-long distance (in the USA) service every month for less than $50 is good. Further, she's an avid SMS user - oh, she gets 300 outbound (mobile-originated) SMS messages a month for $5. Unlimited inbound (mobile-terminated) SMS messages, too.

My wife would not even find it an amusing joke if I offered her an HT with a TNC hanging off of it as a replacement for her 5190.

I travel outside the USA often enough that the sleek little Nokia 8890 caught me eye; the international roaming rates are not cheap, but the availability can't be beat.

It's not that bleak; 3G promises to be the 'catch-up' cycle for the USA. We'll let the Europeans figure it out, then we'll deploy it. We're such Americans, after all.

Everyone in my office has pagers and cell phones that beep and signal their owner every couple of minutes.

I had a cell phone once when I was in the USAF so I could be mobile while on alert, but since then have been using my old rotary phone from 1972.

My feelings about all this, is that it is a complete waste of money. Looking closer at the pagers I see that they have all sorts of messages from AP, MSNBC, etc, etc. Hardly anything work related. Mostly expensive toys. I don't have them, and my pay is the same or greater, and I get my work done in a timely manner. If it would increase my pay 25% to have one, then I'd be interested.

Like the farmer said watching the yuppie jog: "What a complete waste of time, eh?"

You know what I get tired of? All those guys posting simple questions
that easily get answered using any search engine on the web. And wanting

only ready-to-click links in return.
As if the other newsgroup readers are their slaves who are going to do
all the research work for them.

Hello,

I have found lots of information on this, but I am not sure if I can do what
I would like--

I would like to set up a packet station at my home (with radio/tnc),
connected to a computer that will route the packet traffic to/from the
internet.

For example, if I had my laptop with me in my car, I would have a tnc/radio,
and would like to be able to create a tcp link to the internet over my
packet link. I want this to work so I can run things like http/smtp/telnet,
and other normal internet protocols to connect to internet servers.

Is this feasable?
I understand what I need for radio equipment, although any suggestions are
appriciated, but my main concern is what software package I would use to do
this both on the gateway machine and on the laptop.   I would prefer to run
windows on both ends - gateway and remote client.

Any information would be greatly appriciated.

Thanks,
Scott

Scott,

I had done a research project during college and there were a number of issues with doing this. Primarily we didn't want people who were not hams to be using the gateway out from the internet as this would be a violation of FCC rules (must have license yadda yadda yadda)

The system worked pretty good. It was based on JNOS. The primary function was to allow AMPRNet traffic from a different geographic location to be routed through our node and out our antenna. As for going directly from internet->amprnet not a good idea. Consider the 44 network as a non-routable network from the standpoint of the ARPANet/Internet.

Nope. :-)

You're right: manufacturers stop making the chips because there
is no commercial market for them.

I always wonder about the insistence on compatibility with local
networks: here in Vancouver I rarely hear any 1200 baud AFSK on
the packet frequencies. There is thus no local network to be
compatible with...

Thanks to all who replied, I've found a UK supplier that can supply the
3105s. The project is the conversion of a couple of ex-commercial TNCs using
the FX439J modem (1200 and 1800Hz tones) to allow access to APRS, which in
the UK is still getting going and is principally on 144 MHz at 1200 baud.
The TNC in question has sockets on the board for either chip and so avoids
having to make mods, it's just a straight swop.

Regards,

Roger, G3VKM

This means that the resistance to progress must be very deeply rooted in your region. What you should have done (like we did here and was done in many other places) is introduce your fellow amateurs to higher speeds when they became available.

We have had 4800 bps accesses on nearly every node and many BBSes for at least a decade. 9600 bps was added later in many places. When the node or BBS has a higher speed available, a lot of users will follow. Especially when schematics for modems are made available, and/or PCBs and parts kits are sold by a couple of active amateurs or small businesses.

Just sitting down and crying "nobody is using speeds above 1200 bps so I cannot upgrade" isn't going to bring anything.

This is similar to the situation in telephone modem land. When the BBSes and later the Internet access companies would not have upgraded their modems, we would all still be connecting at 2400 or maybe 9600 bps.

But they did, and the callers followed. Nobody is asking for old modems in the shops, so apparently this worked well. Only some banks (accustomed to writing off equipment over a period of 5 years or more) still operate V.22bis dialups for their telebanking...

Rob

Etc...

I am very pleased for you that you have such a good packet network in
your area. Why the UK network never really moved to higher speeds is a
good question, but it is totally academic in this particular thread. The
fact is that most of our packet is still 1200 baud, and there is
therefore a need for 1200 baud modems. To ignore that fact and simply
say "move on" would be to ignore the reality of the situation.

Also, there is now a growing APRS network on 1200 baud. I see a lot of
1200 baud APRS coming from your country, so it looks like even in your
area you still have a need for 1200 baud modems?

See DXMon by VE3SUN...

Gives you a great circle map, distance, bearings etc!!

Best of all it is FREEWARE!! No need to buy expensive logging software!

(see http://www.benlo.com/dxmon.html)

There is also GEOCLOCK with the HAM RADIO PACKAGE. But it is a little pricey.

Many logging programs in the same price range have a similar map feature!
See DX4WIN and LOGIC (www.hosenose.com), etc...

The web page for Geoclock is http://home.att.net/~geoclock/

The "atomic" clock you can buy at radio Shack reads one of the LF WWV
transmissions and decodes the time info imbedded in it to keep itself
corrected.

Anybody written sound board software to extract this time signal from
the output of a radio tuned to that same WWV freq?

Sure would be nice to have an "atomic" clock in the PC.

Jerry W4UK

Hello,

anyone could point to me where I can find the tuners fm with interface I2C or SPI, like Phillips FM1246 MK2 module ?

Mentioned one is no more available.

Kind regards

Roman Rumian

If you have an internet connection you can set your PC clock from NIST directly. I use NISTIME-32BIT.EXE to automatically reset the clock once per day on one of my PC's that runs a sensing application and has poor timekeeping. You can get software from;

http://www.boulder.nist.gov/timefreq/

To just display the time with a geochron style graphic;

http://www.time.gov/

What radio are you talking about? You would need a radio and antenna that
work at 60 kHz, and convert the modulation used on the WWVB signal to an
audio tone in order to feed it into a PC soundcard. At that point, all
you'd need is software. But is there a suitable radio for this?

I have an ICOM PCR-1000 receiver already hooked up to the PC and the
audio is already fed into this PC's soundcard.

I think lots of guys would use the software. If a receiver were not
already available, it should be pretty easy for homebrewers to
cannibalize one of the existing cheap clocks to get the receiver and
feed its output to the computer sound card.

C'mon, somebody, write it. Let it operate under Windows and let it
set the PC's clock automatically and then reset it periodically. I am
stupid, or I would do it myself.

I was trying to do a meteor scatter packet radio operation during the
Leonids last week, in which I broadcast my packets during a prescribed
15 seconds of every minute (see http://go.to/BEACONet). My PC clock
kept drifting so much I wandered out of my time frame after only a few
hours. Lots of other applications for a precise clock in CW meteor
scatter calling, etc, also.

The time signals are there, so why not be using them???

The problem with the APRS folks is that they invent everything anew, and fall in the same traps as the network folks a decade or two ago.

When the first two packet users came on the air, they could make a CONNECT. When the third user came online, he could not connect one of them, and the DIGIPEATER was invented. This "worked".

But when everyone in the area was on packet, the sheer number of collisions made any contact impossible. So, the "hop to hop" acknowledge "idea" was invented, and NET/ROM appeared.

This worked better, but there still was the problem of hidden stations, causing excessive collisions.
This was solved by putting each NET/ROM local access on a different frequency (re-using frequencies only at larger distances), and linking them together using a network of point-to-point links on another band.

Now, each local access area was an isolated small community on which it was relatively easy to propose to change to a higher baudrate, especially when the old rate remained available for some time.
This is how it was done. Higher rates were added and in the more busy areas, 1200 baud was gradually phased out. Users could still connect to anyone via the node, as it would do the rate conversion as required.

Enter APRS. Rewind tape. Everyone again on one frequency, using a single speed, using digipeaters. Slowly they find out the same problems as population increases.

But they have largely painted themselves into a corner by requiring that everyone can hear everyone on a single channel. "Intelligent digipeaters" are re-invented to partly solve the problems, but a real solution requires a fundamentally different approach, like a re-invention of the cellular frequency planning. This will of course make mobile use more difficult, especially for amateurs that only want to use existing commercial equipment that would not lend itself to some form of automatic frequency control.

In this world, which is largely separate from the previous packet experiment of BBSes and nodes, it is not surprising that the same error was made when selecting an operating speed.
However, there are groups that use higher speeds. On 70cm, not the 144.800 net you are probably referring to.

Why do you want to use a soundcard?

Here in Europe the transmitter of choice is DCF-77, and many household clocks for it exist. They can be bought for prices starting at the equivalent of US$ 10..15 (for a battery-powered alarm clock)

The output of the receiver section already is a digital signal. So instead of feeding this into a soundcard, one connects it to some spare input (usually a status signal on the RS232 port).

Several programs exist to sync the PC time using this setup.

Who would want to tie up an expensive receiver for this?

Rob

Doesn't CHU (3330 kHz, 7335 kHz, and 14670 kHz, Ottawa?) transmit time standard data as Bell 103 standard FSK on AM? There are lots of hardware construction articles and software out there to easily decode this data stream.

Nowadays, people also use GPS sattelite signals for time standards as well.
I believe there are sync error tables published on WWVs web pages somewhere.

Ok. Does the PCR-1000 tune down to 60 kHz? When you tune there,
what does the signal output look like? The PCR-1000 has a number of
demodulators available (FM, WFM, AM, SSB, CW..) but the WWVB signal
almost certainly doesn't use any of those modulation schemes. Does

the PCR-1000 give a decodable signal out anyway in any of those modes? And, if so, is the signal actually an audio signal that can be digitized successfully by a sound card, with its limited frequency response? These are the kind of details that determine whether this is possible or not.

>C'mon, somebody, write it. Let it operate under Windows and let it
>set the PC's clock automatically and then reset it periodically. I am
>stupid, or I would do it myself.

There's another possibility, too: just about any board-type GPS receiver outputs the current time and a pulse each second, accurate to a microsecond or so. This can be used to keep a PC clock quite accurate, and there's software available for this. If you only want accuracy to the nearest second or two, any handheld GPS receiver with NMEA output will do. See www.tapr.org for suitable hardware and software.

Dave, the signal is at 60 KHz, and is modulated by a 10 dB reduction at
a rate of one bit per second.  You would need a frequency response down
to DC to use a sound card.

I don't see that as an "error." I see that as an issue of supply. As all the BBS's and nodes went to 9600 baud, there was a flood of 1200 baud packet equipment on the used market....

They're repeating history because they're USING history!

The difference between APRS and BBS packet, is that the content is several magnitudes lower in quantity, thus more stations can exist.

Since only moving targets need to update their position, that leaves many stations that need only broadcast every hour.

But just like everything else, a few Hams can cause problems. Those Hams that use long strings of digi's, and broadcast their static positions every couple of seconds, can also be found on 75 meters slobbering all over themselves to debate the advantages of being a Caucasian.

"Rob Janssen" wrote

Over the last few years I have spent a considerable amount of time 'surfing' the EU packet network. When the solar cycle was low, I accessed it via a wormhole. For over a year I have been using HF pactor to connect to the network using the various gateways there.

The robustness and efficiency of the EU packet network is astounding. It works so well I suspected that there were alot of wireline links involved, but after inquiry to several sources have found it is all done via RF links. I guarentee if you spend just a few minutes working on the EU packet network you will get hooked, and spend as much time as possible working their incredible network.

Sadly, the German Regulatory Authority for Telecommunications (RegTP) is trying to draft a decree which would effectively disable the German packet network. The harm done to the entire EU network would be great if this happened. In the enclosed message, there is a request to send a polite email to the RegTP asking them not to pass the decree. Please send an email to them in support of our friends in Europe !

Here is a message from Tom, DL3SBB and Uli, DK2GO with more information:

-----CUT HERE-----
From: DK2GO @ HB9EAS.CHE.EU (Uli)
To: SYSOP @ WW

Hi,

we'd like to inform you about the current situation concerning the german paket-radio network.

As a sign for protest a lot of german packet radio SysOps will cease operation for a certain number of days starting on November 24, 1900z.

Major AX25 nodes in Germany will shut down their links with the execption of their local user access. All additional supplementary services like BBS, DX-Cluster, convers, TCP/IP etc. will be shut down too.

Therefore participating stations won't be routable through their networkinterlinks. BBS message and bulletin forwarding will be interrupted in most parts of Germany during the protest. There are even some "foreign"nodes, close to the german border, participating.

Reason for the SysOps' protest is a draft of a decree ("Amtsblattverfuegung") by the German Regulatory Authority for Telecommunications and Posts (RegTP).
If this draft will become reality, these rules will dictate explicite procedures for almost any operational aspect of an automated amateur radio station, including their supplementary services.

For the SysOps participating in this action, such pedantic ruling is inacceptable. Most will rather shut down their automatic stations, esp. the supplementary services than accept these bureaucratic and completely unrealistic rules.
This protest is intended to demonstrate what might happen if the intended decree will become reality.

Currently, the AX25 Packet Radio network in Germany is one of the fastest and most efficient worldwide, although (or rather: because) it does not rely on the internet, but on high-speed radio interlinks on 1.2 GHz and above.

The users of the nodes will be informed about the reasons for this
protest and are kindly asked for their support.

The participating SysOps do not want to offend anyone and are
apologising for any inconvenience caused by this action to the
international Packet Radio community. However, they would like to make
it clear that the situation is very serious and that support is needed.

If you want to support us, please consider writing a polite e-mail to
the RegTP.
mailto:poststelle@regtp.de
Subject: "Amateur radio service, draft for automated
remote-controlled stations".
You might ask not to deteriorate the existing liberal amateur rules for
automated stations by installing unnecessary bureaucratic regulation.

You can reach the English language homepage of the German Regulatory
Authority for Telecommunications and Posts (RegTP) at
http://www.regtp.de/en/index.html

Thank you for your understanding and support.

73
Tom DL3SBB and Uli DK2GO, speaking for about 80 participating SysOps

>SPI, like Phillips FM1246 MK2 module ?

Take a look at www.infracom-fr.com or www.infracom.fr they distribute COMTECH tuners on 1.2 and 2.4 GHz. A single tuner costs around 250 Frs I think, 38.11 EUROS or about 32 USD. Ask them, I'm note sure that tuners are shown on their website, but they show 1.2 and 2.4 GHz TV modules, with PLL controler, amplifiers, and so on.

Yes, that could be (a large) part of the explanation.

Not only that, but the system has also been built out to be a replacement of the original "keyboard to keyboard chat" system that connected mode packet was. This causes an awful lot of traffic, as every packet an operator types is broadcast and repeated over a large area until the destination finds a chance to broadcast his reply back.

This was bad in the times of normal digipeaters, but it is even worse now that generic digipeater names like RELAY and WIDE are used, for which several stations repeat the same packet.

Ideas like this work fine under light loading, but once the load exceeds a certain limit there will be a collapse because acks are not coming back and the re-transmissions increase the load that was already high.

Of course this problem could be reduced by a factor of 8 by changing to 9600 instead of 1200 baud, and thus reducing the channel load by such a factor (assuming TXDELAY is reduced accordingly).

You should hear the commercials they are running in Cincinnati. "Unless you don't have any unhappy current or former employees, then you need to worry about the BSA." Also, " this is not a traffice ticket". Turn yourselves in now.

In the U.S. it's not a problem, because more Hams are dying every
day, than are being replaced, with only a fraction of the total population
having a digital capability.

The answer of course, is to use S band with the new AO-40 satellite.
It should be able to handle digital voice, data, keyboard, and GPS
beacons without breaking a sweat...

Unfortunately this (and the text you quoted) is a very partial account
of what is going on. Not much is known to the public and jumping on
the bandwagon of this protest might be not exactly the best thing, at
least not without informing yourselves:

It *seems* that central issue in this conflict is if the sysops should
be allowed to exclude and route selectively ("censor" in the words of some)
based on originating call -- arbitrarily and without giving any reason or
informing the regulatory body.

Conflict seems to have escalated when the amateur radio association "AGZ"
(http://www.agz.net) wanted to distribute their anti code-test bulletins
and calls of AGZ members were blocked (out of pure dislike in a discriminatory
fashion?) in the process. RegTP *seems* (the paper is still not available
publicly) to be of the opinion, that this is not acceptable under current

law and that content on the network cannot be filtered out (or "censored")
unless it is against German law. Therefore they revoked two digipeater
licenses that were involved in these actions.

At the moment there is quite a flamewar about this in de.comm.ham (the
German-speaking ham newsgroup) and I think you would get responses of
both parties in this conflict there -- if you were interested.

This is *not* an issue "us" vs. the evil regulatory body however!

This thing is already very emotional (like the pro/anti CW test fights
in rrap in some way) and *not* a one-dimensional clearly cut thing.

/ralph -- not from Germany myself, but from Austria close by.

Both WWV and WWVH broadcast time/date signals continuously on HF. Listen
to them using a receiver with decent low frequency audio output. That
low frequency tone (sorry I don't remember its frequency off hand) that
starts exactly on each second pulse and lasts for a fraction of a second
contains the code. The longer tones are 1s and the shorter ones are 0s.
These are the tones that the famous Heathkit Most Accurate Clock used.
Should be no problem at all to detect and decode them with a sound card.

Hi,

Anybody still using the BPQ host conferencing program called FASTCHAT ?

Just curious.

Hi,
Anyone know where I can get a complete description of pactor-II?
If the specs have not been published, is it legal to use?
tia,
KG0T

I am giving you an entirely biased answer...

TMD700A is the radio I mean THE RADIO you should buy. I spent big bucks for one and liked it so much I went out and bought a used one on ebay and saved $150 plus tax. It doesn much much more that it advertises.

check out this site and look for the complaints. OKAY some intermod but what wideband radio doesn't have intermod problems?

The pactor-ii modem is compliant with all rules established in
U.S. the statutes.  But there is some legal wrangling over what
the term "is" is, and we must count the 10,000 ballots that
"were never counted, not even once."

Well, APRS is intended for telemetry, not chatting. Chatting shouldn't really be done using anything but the exact path needed, but I don't think the software available is flexible enough to direct messages as required.

I wouldn't really agree with that, although I expect attitudes vary from
one part of the world to another, according to the whims of the local
(self-appointed) rule makers. (If this thread has proved one point, it
is that there is little of "doing it for fun" left in packet. Whatever
you do, there's always someone more than ready to tell you that you
shouldn't be doing it!)

UI-View allows you to select the path for individual messages, remembers
the last successful path you used to contact a station, etc.

A 60KHz receiver is possible, of course. One needs to detect the 1pps 10dB signal reductions of the WWVB carrier, then validate and decode the 60-bit word that results into time and date, then set the PC. A 60KHz receiver would likely be dedicated to that function alone since it wouldn't suit any other service (except for NPL's MSF time service in the UK, which uses a different modulation scheme).

Instead, I suggest that you consider decoding the modified IRIG-H code that WWV and WWVH transmit on a 100Hz subcarrier of 5, 10 and 15MHz. Most communications receivers will pass that audio and a sound board could certainly be used to decode it. Again, the data needs to be decoded and assembled into time and date before a machine could be set to it. Unless you are privileged to get a solid WWV signal, you'll have trouble with noise and fades, and you'll need to validate the data you think you've received.

I chose to do the 100Hz detection in hardware. I built a PLL-based 100Hz timecode regenerator for this purpose and I wrote a tool that accepts the 100Hz data via a parallel port pin. The program is called TakeIrig.com; it is supplied with the RighTime evaluation package at www.RighTime.com. A corresponding timecode generator program, MakeIrig.com, can be used to test your setup. These are both DOS-based tools; although they work under Win9x if the data can get to them, Win98 tends to commandeer the ports and often defeats successful use of TakeIrig.

Good luck.

If you take the minimum and maximum voltage points of a signal,
and divide that by the number of bits, you get the volt/bit value.
The smaller this ratio, the greater the fidelity (spectral purity).

More bits also equates to greater dynamic range (the difference
between the smallest signal, and the largest).

But great things have been done with few bits. Voice for example
can be digitized with 1 bit and this digital value be used to drive a
PC speaker.

Sampling rate also plays an important part. If you can oversample the input signal, the chances are, that each value won't change much, and a differential type encoder can be used. Today's computers are so fast, and A/D's are so fast, that oversampling is quite common at the audio frequencies, less common in the MHz IF's.

I'm not saying it shouldn't be used for chatting; any activity is welcome. But I think WB4APR's original intention was telemetry.

> UI-View allows you to select the path for individual messages, remembers

> the last successful path you used to contact a station, etc.

Excellent; sounds like that's exactly what's needed. Your software
is popular down here in VK3 and I recommend it to new APRS users
because it is easy to use, reliable, and inexpensive.

Regards,
Hamish

I just downloaded the soundcard program noted above and really like it.
I am however having one small problem that surely someone has a simple answer for.
After I set all the macros and parameters and want to exit the program, there is no way to exit (that I can find) except to drop it out of Windows and then all the saved information is lost and has to be reset the next time I use the program
There has to be a better way of exiting the program without losing all the presets..
Any suggestions?
Thanks in advance
Dick K9RT

From WB4APR's DOS APRS README.1ST:-

******************
Think of APRS as just a multi-user distributed packet network with a MAP
display for many exciting amateur applications:

Network topology monitoring
Direction Finding
Weather reporting
Frequency Coordination database
DX cluster monitoring
HF DX plotter
AMSAT ground station tracker
Satellite tracker
Search & Rescue
Special event tracker/organizer
Boat/mobile/RV tracker
RF path estimating
Local area CHAT mode   <-----------------
Telemetry displays     <-----------------
Airline tracking
******************

Yes, this seems to be re-invented by the APRS folks too :-)
Back in the early days of packet there would always be a few stations
beaconing "advisory" texts about parameter settings and behaviour. Or
arguing with stations who were doing "too much" BBS downloading.

However, once we had a decent networking system with distributed access
channels instead of the everyone-on-one-channel system this disappeared.

I was amused to see it back when tracing the crowded APRS channel...

Rob

I have an SA-2060 (and a -2040). I have never used mine at that power level on RTTY, but my feeling is that the BALUN is likely the weakest component other than possibly the antenna switch (in the -2060 only).

I'd be curious what you find out.

Brian

 You CAN change it back. I did. Just go into control panel then regional settings then select the time tab and change it there. Curiously, the 2nd time I ran it the problem didn't happen again.

Jeff,

I see that another has already brought up the balun as the possible weak point, so just let me relate my experience...

This is with an SA-2040 tuner.

So there I am, running about 400-500 watts RTTY on forty meters late one night, when my nose, (a primary diagnostic tool at WG7X), started telling me that something in the shack was getting hot! Nothing like the smell of frying plastic to get you going! After saying my 73 Etc, I put the 'ol sniffer to work, and naturally it centered on the tuner.

Well, it took me about 5 minutes to get a screwdriver and remove the top off the tuner, and when I did a great big cloud of white smoke rolled out. I had fried the Teflon tape surrounding the balun cores... Well, baked it really.

It was a nice golden brown, and still smoking five minutes AFTER the RF was removed!

All this heating occurred at a 1:1 indicated SWR on my external meter and about 500 watts forward. The inductor coil was also a little warm, although to be fair, with the amount of heat generated while baking the balun, it was a little hard to tell. I had noted that more heating of the coil occurred at higher frequencies, especially 10 meters.

The answer here is a remote balun. Nowadays, I use a Nye-Viking MB-V-A. Now there's a REAL KW+ tuner. I still have the Heathkit tuner, and will use it at times, but be very careful at high power, and especially with high values of SWR.

YMMV... HI!

Gary, WG7X

I have been unable to get the obscure chipset onboard sound on my HP Pavilion to work with Linux. Who can recomend an inexpensive soundcard that they have personal experience with using under linux with Ham packet, sstv, and psk31 software.

Just to preserve bandwidth, Im asking a specific question, No need to reply with "Any SB compatable should work", "I use this soundcard with WINpsk", or "A Soundblaster Super Pro Awe 256 Dolby 3d works great with linux and only costs $795.95". Personal hands on experience with making an inexpensive card work with Linux (Mandrake 7.x) is what I hope to hear about.

Even though this will piss off some usenet hardliners, I would apreciate it if replies were to 'CC' my personal address. If this request offends someone then by all means, send the reply only to the list. Ill still see it, just delayed. Much as I would like to read every message every day, realities of time management force me to read only a hundred or so once or twice a week.

Now that I've authored my one sentance question and two paragraphs of attitude, Ill shut-up and hope I havent offended the people with the answer so much that they wont respond.

Steve

I use a soundblaster 16 pnp. It works fine on psk31 and sstv and is not
difficult to set up.
I first used it with Redhat 6.2, but am now running SUSE 7. I'm pretty
new to linux,
but did not have too many problems getting going.

Hope this is of use.

Did the the isapnp.conf setup prove any particular challenge to get setup?

You know, Someone ought to develop a soundcard specifically with hams in
mind. With a PTT interface and switch options to make the input and output
directly compatable with and isolated from various radios. Using a
chipset which is widely supported and/or documented well enough and openly
that support would follow.

I am using K4ABT inferface for PSK. I am experiencing a computer problem that I do not think is the problem of the interface.

When I first turn on the computer, the transmit light goes on and off once or twice through the boot up cycle. When the computer has completely booted up, the transmit light comes on and stays on. If I load up Digipan the light goes off until I transmit in PSK and then goes off as soon as I switch to receive.

If I exit the program, the transmit light comes on again and stays on. When the light is on, my rig is in transmit so the effect is that if I want to use my rig for listening or on other modes than psk when the computer is on, I must leave Digipan running in the background (or presumably one of the other programs such as PSK).
Have anyone heard of this before.

It seems that my serial port defaults to the transmit condition unless Digipan is running and that returns it to the receive condition until you hit the transmit button. Is there some way to configure the serial port so that its default condition is not transmit?

Any advice.

Thanks.

Slightly off-topic, but I'm sure you'll all be amused / irritated / amazed ...

=============== Start of forwarded message ===================
BSA deploys imaginary pirate software detector vans
By: Kieren McCarthy
Posted: 08/11/2000 at 10:57 GMT

The Business Software Alliance aka The Pirate Busters is growing so frustrated in its hopeless efforts to cut down on software piracy that it has decided propaganda and misinformation is the way forward.

Visitors to Glasgow Central Station yesterday were surprised to be confronted by a Ford Transit van with a small radar and rusty Sky satellite dish mounted on top. What was this apparition? Why, the BSA's latest weapon in the war against software-stealing scum.

A wise reader asked one of the "consultants" what exactly the dishes were able to do and was informed they could detect PCs running illegal software. When pushed a little further, she admitted the van was "just a dummy" but the BSA still had a fleet of the real things rushing around Scotland detecting and nabbing unsuspecting criminals.

Expressing incredulity, things turned nasty and our loyal reader was threatened. He'd "better watch out" because the BSA with its new super software-finding equipment will "get him easily". He quickly ran off and slid into the shadows before he was photographed and his face wired to Interpol and the CIA.

Can you believe this? This has to be one of the most insane things we've heard in years. The BSA needs to take a valium and lay down for a bit.

Ah, yes, the wonderful AD1816-based Pavilion soundcards, I'll bet, that don't work with any of the standard 1816 drivers. :-(

I use the Creative PCI 128 in one machine running Linux, and it works just fine for everything from the soundmodem drivers to Quake 3. :-) You use either the Ensonic 1370 or 1371 drivers for it, based on which particular chipset the board contains. I believe it was about $40.00.

I also have the Creatve 16 AWE PnP ISA card, which was a *major* pain to use. Apparently there are a *lot* of different chipsets that have been used for this card. I ended up having to purchase the commercial OSS drivers ($15.00) to get it to work well - none of the free OSS drivers were usable.

Fellow Packeteers,

It looks like packet is once again becoming popular in New Mexico again (perhaps the WWW is losing its touch and people are resorting to packet for Amateur Radio fun?), particularly the Albuquerque, Roswell and Santa Fe areas.

Full-time, forwarding BBSs are alive and well in these cities, but there are no links outside of New Mexico via nodes yet. This means we are unable to forward packet traffic in and out of the state.

My question is...how can we get traffic to and from our BBSs? Is there any place on the Internet where the SYSOPs can download the traffic (bulletins, personal messages, etc.) to the BBSs? Are there any other alternatives, other than setting up nodes (which we plan to do sometime soon I hope)?

Any help/suggestions would be greatly appreciated.

73,

Brian, N5ZGT

Hi,

I'm looking for a program to use in Windows that shows all PREFIX on a detailed map.
It would be great if I even can calculate worked distances and bearings.
All info is welcome on thsi subject !

Thanks and 73 de Phil

Hi Steve,

I've had good sucess using the Crystal Chip set I've seen these Crystal boards mine is 4235.. for as little as 20 bucks , check around see if you can find one.. also the Ensonique boards have worked well with my linux box , but are a bit more expensive..

Being new to PK31 I have been looking around and have noticed that all the signals I have seen are running BPSK mode. Is there no QPSK activity? Curious as to why I am not seeing any.

Heh. Have you been monitoring r.r.a.digital.misc at all? Forwarding
via the net, even to keep an isolated community alive, is highly
contentious.

You might consider HF forwarding, I think there are a few HF gateways
still around.

If you really do press ahead with plans to build new packet infrastructure,
do your darndest to make good use of this "second chance" and insist on a
minimum of 9k6 links.

I asked the same question a few days ago. The following is a technical
explanations that I received.

Here is a quote from the help file for the original G3PLX PSK31 program
(PSK31SBW):

"For paths where errors occur in bursts rather than randomly, PSK31 can be switched to use a convolutional code at the transmitter and a matching Viterbi decoder at the receiver. QPSK, with 4 phase-shifts instead of two, is used for this, but the bandwidth and text speed stay the same. The price paid for this robustness is a tighter frequency stability requirement and a delay of 640mS in the decoder."

I tried QPSK on 10 meters a few days ago and could not maintain contact. I hang out on 10 mtrs at 28.120 +/- and would like to try qpsk sometime.

You can't "insist" on anything. It's a hobby. You can bet it will be
1200 baud and low buck.

I would probably spend the little money available on an S-Band system
for the Oscar 40 satellite. This will make HF packet a dead issue.

You could use Ham Radio ...

There are plenty of folks willing, ready, and able to forward
with you on any of the HF bands, using CLOVER or PACTOR.

Just let us know when you are on air.

Hello,

How to connect my transceiver Kenwood TH28e with my AEA PK-88 ?
I find the receiver but no the emission (and commutation).

Many thanks

Probably because BPSK works so well that no one bothers to switch to
QPSK. I've tried it a few times but didn't see much difference.

IMHO most people just use the default (which is BPSK for most programs) and pay little attention to the signal type. I've seen several ZL and VK stations calling CQ on 20 and 10 in QPSK that got ignored.

An occasional glance at the "phase scope" to see if there are 2 lines or 4 would be in order if you want to work some DX.

Hi all,

I'm developing some software which will support controlling your station's radio(s) as part of its functionality. So far I have support in for the radio I own (FT1000mp), but am at a loss as to how to get the protocol info on all the other radios out there. And then there's the testing issue... Anyone else tried this? Any suggestions?

Thanks,

Larry, WU8U

Phil,

Some logging software gives you that information as you enter the call prefix of the station you are working, or the DX spot you want to work. DX4WIN, for example, lists the direction and distance to the remote station, and also includes a 'globe view" of the short- and long-path routes from your QTH to the other station.

<Standard Disclaimer: no ties to DX4Win, just a happy customer>

Hello All:

I'm looking for a piece of software that will allow me to use my
computer as fsk (afsk) tuning indicator for the HF bands. Should have
settings for 170Hz, 200Hz and 1Khz.

Need for receiving 1200baud bell202 on 28188.50 packet.

Thanks

de Richard/N2JR

How about one of those "spectrum analyzer" (with classic display or
"waterfall") programs?

Rob

As always start here for sound card programs.

http://www.muenster.de/%7Ewelp/sb.htm

Can't tell you which one will do what you want, but lots to choose
from. Maybe the wintone program.

There are some teletype programs that are nice for the 170 and maybe 200
hz. Look at the mmtty program. It has a nice display for the tones,
not sure if it will do 1000 hz or not.

This is all under various versions of Slackware, from Slackware
97 to 7.1, systems ranging from 486/66 to P3/550.

Current system: no-name Crystal-based card.
Past: SoundBlaster 16 ISA.
```

Experimented: SoundBlaster 128 PCI.
Abandoned: CMI8330 SoundPro on motherboard.

I found that I could play sounds just fine on the CMI8330,
but couldn't get it to record. Obviously a mixer problem,
but with sound cards so cheap I opted for a replacement.

The current Crystal card is Plug-n-Pray. I set it up in Windoze,
wrote down the settings and configured it with isapnp. No sweat.

SoundBlaster 16 ISA worked with everything. As it should.

SoundBlaster 128 PCI sounded gorgeous, so I gave it to my
Mum (who does lots of music and stuff). Overkill for making
modem noises.

The general rule remains: the cheaper and more generally
brain-damaged, the better.

It's really not that big an issue. Honest. If it doesn't
work, take it back.

Sorry, but these are long obsolete, and completely unobtainable.

Shred any magazine article that uses them.

Any equipment that needs a replacement is scrap.

Consider MX-614 as a current (but not drop-in) replacement.

It's mainly the technology (1200 baud AFSK) that is obsolete, and has resulted in the chips to become discontinued and unobtainable.

Defeating that by choosing a chip from a smaller manufacturer that still sees a niche market is not really the best approach. It is better to move on. Come on, are you still using that V.22 telephone modem??

The best way to get these obsolete chips, is to buy some
TNC's for parts.  But I concur that anyone designing anything
new using that chip is misguided.

Mm, but if I moved on, I would be all on my own. A luvly high-speed
system with no-one to connect to... That's the problem - In much of the
the real world of packet (as opposed to the theoretical world of packet)
there's still an unavoidable need for 1200 baud modems.

My experience with a slower computer is that some PSK31 software will work, but some will not. I have seen one program where the computer was not fast enough to display the audio spectrum, but if I disabled that feature it was just able to keep up with incoming signals. You might just have to try different programs until you get lucky and find one that works. You may find the "System Monitor" program (Start/Programs/Accessories/System Tools) helps to show you whether your CPU is too slow to keep up while you are receiving a PSK31 signal (CPU usage lower than 100% is OK, but if it stays at 100% you may have a problem).

I would guess that the "original" PSK31SBW software by G3PLX will work on your computer. If it doesn't, you are probably out of luck. However, with a slow computer you might not be able to take advantage of convenience features such as dual channel receive found in newer software.

If the computer is too slow, you will observe that the screen display gets behind the input (e.g. after the signal you are receiving stops, the program keeps right on decoding for a while), and the program becomes extremely slow to respond to mouse clicks and keyboard input. It is not usable for conducting QSOs this way, as it soon gets so far behind during receive that you cannot switch to transmit in time to carry on a conversation.

Jim,

I used DigiPan 1.2 on a 60 MHz Pentium with no problems. I recently upgraded to a 750 MHz Athlon and don't see any difference when running the same software. Both computers use rather plain SoundBlaster cards.

I'd like to get in contact with anyone running PSK31 on a Yaesu FT-990 to discuss how to set this up. Please respond to my e-mail address.

thanks,
Jay

Try it and see. This is the only answer in borderline situations like yours.

Think of what the software does: it receives 8000 samples per second from the sound card (this is the sample rate many PSK31 programs use). It must process each sample before the next one arrives, in addition to any other activities the OS may be performing. If it can't the software won't work. Period.

I've had a 486/66 that was non-functional on PSK31, a P233MMX
that did it with ease, and currently play with a P3/550 that
hardly notices (1.1% CPU time).

I'm not an expert by any means, but could a solution to the frequency drift problem due to temperature be to reduce the RF output of the rig (and the heat produced) and use an external amp to make up for it?

It would make sense that the drift would be from the rig, not the amplifier. If I'm off base let me know cause that's how I'll learn. I haven't been in the game long so I'm probably missing something.

Hi Jim,

You might be able to get a bit more power out of your computer by overclocking the CPU. This is true especially if you have one of the later Intel P75 CPUs. According to what I've read many of these chips are actually faster chips sold as P75s. The story goes that manufacturers still wanted to market P75 computers at a lower price after Intel had switch to making faster chips. To satisfy the demand it was easier to just stamp the faster chips with the slower chip info. there would be no problem with them running at a slower speed and this was a lot cheaper than having to setup the production line to make slower chips...

As to whether this is true or not, I have no idea but I can tell you from experience, I have run P75 CPUs as P100s for years with no problem. the chip doesn't even get hot.. hi.. I had one running as a P120 but decided not to press it. Now I have some spare P75 that are worth nothing (under $5 on the auctions) I should give that a try on one of the old machines.. hi.. I run the CPU at 3 x 33 Mhz and on boot up the computer recognizes it as a P100 and do test programs..

So if you can change the settings on you machine this may be worth a try. All you have to do is watch that the CPU does not run too hot. In my tests, if the CPU doesn't like your settings it either will not start up of will quit after running a short while. Reducing the clocking speed has always got the computer running again.

73 . . . Casey

Hello everybody
I need some information about digital Filter built araound a analog/digital multiplexer 74HC4051. How does it work exactly.
Perhaps somebody has the description of the the issue QEX may 1999 with the title "a digital commutating filter from Kossor Michael G. WA2EBY.
Does somebody know the link of the Homepage from WA2EBY.

Thanks for your help

Looking for a hookup for my TS440s for PSK31
using the "afsk in" and "afsk out" rca connectors
on the back of the xciever.
Also need the mode setting that is used for this.
I'm told it can be done, but no one seems to know how.

WA4DSY 56k Packet node (new)
Microwave Modules MMT432 High speed transverter
PackeTwin serial sync interface card

I have the node working on a test bench but never put it on the hill.
Current configuration is using a Pentium 133, RH 6.2, Jnos and xFBB
packet apps tied together using Linux AX25-UTILS.

Asking $600 for the lot. You pay shipping. I will trade for a solar
panels 100 watt or greater

73, John
aa6qn@juno.com.

I understood that agwpe only runs 1200 and 9600 using the soundcard tnc.
2400 is not available yet as far as I am aware. Is this correct?

I am sad to say that I am the only Kiwi out there who has the 'writlog software'. I have tried under my own bat to understand and get into working order this program. Unfortunately I am really struggling.

Would someone out there like to teach a very elderly person by means of extramurally.

I would really appreciated it.

Please e-mail me at the address under. Thanking you in advance.

The real answer here is to consider upgrading the speed of the processor. Since it is getting a little old, if the motherboard will handle something faster, the thing to do is to either try upclocking the existing processor to 100 MHz or finding another chip for $5 or so to run faster. Very possible that the board will handle a faster chip speed.

Hi

Looking for recommendations on a �beginner�s to advance� tutorial for Linux / Unix preferably a pdf file that was intended to be read from beginning to end (not a help or reference manual).

I have seen a lot of them out there and the problem is to choose one and start learning, I can�t read them all.

So far I got:
RUTE USERS TUTORIAL by Paul Sheer
and
UNIX IS A FOUR LETTER WORD AND Vi IS A TWO LETTER ABBREVIATION by Christopher C. Taylor.
Both look good and I�m awaiting your recommendations.

THNX, Jeff

I have seen a number of methods of connecting a TRX to a computer.

I want to know if anyone out there is currently using a Kenwood TS870
with a sound card for PSK31 - Stream - MMTTY.

I would obviously like the simplest but most efficient method. If you
have experience with the above TRX can you let me know what you think
please?

I have a very clean PK96 by AEA works perfectly just doing some other
higher speed
packet need to sell for some other equipment I will trade for a 100%
working 6m module for a Yaesu 726R radio.

Please contact me via email below if interested thanks for reading
message.

I recently downloaded and installed DigiPan version 1.5 to upgrade from version 1.2. Every time I start the program, the computer's clock display in the system tray gets changed from 12 hour to 24 hour style. I must go to control panel - regional settings - time to change it back. This did not occur with version 1.2. The computer is a Gateway Select 750 MHz Athlon. Has anyone else experienced this? I have not found any option in the Digipan menus to change this and also looked at the digipan.ini file in the windows directory for possible settings without any luck. It's not a big problem - just a minor nuisance.

I have a TS 440SAT. Just connected the small speaker out on the back to the line in of the soundcard using a standard stereo (3 conductor) cable. WinPSK works fine.

Yup, it happened to me yesterday as well. A minor pain but it does indeed change the system clock. Had me screwed up a bit for a while because I didn't notice it right away. Hope they know about it and will correct it. All and all a great program otherwise, I love it.

Hello,

If you use dxworld.com for your spots you might want to check out a
java interface that I created. I like the information that can be
found at the site, especially the 6M spots and QSO areas.

But I wanted to change the format of the displayed data slightly,
use less screen real-estate and less bandwidth. So I came up with
this Java app to do the job. (I also did this project to help me with
learning Java and IBM's Visual Age Java environment. I find it's
very helpful to have a "real" project when learning another
language/environment.)

For more info and to download the classes goto:
http://www.dbbear.com/k0emt/dxSpot.html

you may also want to check out:

If anyone is interesteed, I have created both an Access/VBA and VB
Class modules for querying the QRZ! CD by callsign.

I am distributing them under the LGPL.

Email me for more info. If there is enough interest, I will
put them up on my web site.

What kind of TNC?

I did some AX.25 routines in VB 5 that talked to a KISS TNC
(an AEA DSP-2232, if you're curious). Used them to do things
like monitor 9600 baud satellite telemetry and digipeat
keyboard input off LO-19 and IO-26.

Kevin, you need to use the MScomm.ocx control (in your Vb project) and
know the TNC commands, is like you want to control a modem.

Laura,

Excellent,

Its a PK232 and possibly later I'll want to talk to a Tiny2...

I'm interested in anything you can let me know basically.

Especially how to talk to the TNC while the TNC is already downloading
traffic.. All my experience so far just jumble s the lot together.

Look forward to hearing from you.

You need to re-download and re-install it again... That bug has been fixed but the version number was not changed, however, the current version at: http://members.home.net:80/hteller/digipan/download.htm

Will take care of the problem

Why is everybody mentioning the make of his computer??

That has nothing to do with the date/time localization settings...

Apparently that program touches those. An application program should
not do that, but Windows 9x of course doesn't prevent it.

Maybe the author wants to educate fellow hamradio operators about the
existence and advantages of the 24h system?

My starting place was one of the VB 5 sample programs, a terminal program. From this I was able to figure out how to use the serial communication control, see incoming data and prepare outgoing data.

The incoming data routines grabbed the serial input and submitted it, one octet at a time, to a finite state machine that decoded KISS. Once the program had received a complete frame it decoded the AX.25 header, extracted the data and made it available for further processing.

For transmission I prepared an AX.25 header, glued it to the data, performed KISS encapsulation and squirted it out the serial port.

When you do it this way you have to handle the protocols yourself. Doing it with satellites was helpful, since all I had to implement were UI frames.

The big question remains: just what do you want to do?

If others had not mentioned the type of computer involved, I might have
thought it to be a problem unique to my machine. Obviously, that is not the
case after reading all the replies to my original post. I was simply curious
if others were experiencing the same thing. Thanks to all who shared their
valuable experience and advice. 73

I was wondering if the Heathkit SA-2060 tuner
would handle 1500 watts RTTY.
Anyone having any experience with this setup
and could shed some light it would be greatly
appreciated. My gut feeling is it would be no
problem but I don't have experience at this
power level.
Thanks,
Jeff, N0OST

Thomas Edison describes in his patent application for the wireless telegraph in May of 1885 as follows;
For receiving signals I locate in said circuit between condensing surface and the ground a diaphragm sounder which is preferably one of my electro motograph telephone receivers.

The first wireless telegraph picked up the telegraph signals with a loud speaking telephone. De Forest patented his triode in 1907 twenty two years later. For his first radio he used an Edison loud speaking telephone.

Edison's Patent and an essay about wireless transmission can be seen on my site at www.geocities.com/starapex Click on the radio

Cheers
Ken McKenzie

> But perhaps there are only two doing it properly?

I think much of the corruption evidenced in wired forwarding are down to two causes:

BID and From line rebranding: Where a 'helpful' BBS forwards into another without making arrangements first, and the receiving BBS treats the message as coming from a local user rather than trunk BBS traffic.

Corrupt and additional characters:

Where BBS export files are imported into a mailer program, and sent by internet e-mail to a recipient for extraction and conversion to an import file for insertion into their local BBS. Wordwraps and formatting characters may be inserted by mailer programs.

> Internet links are even being used over short distances within the
> UK to replace broken RF links, thereby removing all incentive to
> ever properly fix the RF links.

Your comment raises a very vital point on the question of ethics with regard to the forced removal or failure of network radio links.

I feel it is worthy of more discussion not just by you and I, but a representative cross-section of the UK packet community.

What should happen if an area of the UK packet radio network is cut-off either on a temporary basis, or permanently because those operating links that travel out of that area have given up, and operators who could help provide a replacement have not come forward ?

1) In the case of temporary failure, should BBS operators revert to the traditional 'disk in the post' system rather than make use of wired electronic transport ? I should point out to overseas readers that NOV'd facilities like UK BBSs cannot legally improvise a replacement link 'on the fly', but must seek official approval first, unless they are already authorised to operate on that particular frequency with the specified aerial characteristics and limit of ERP.

2) In the case of a permanent cut-off, should an active regional packet radio network be abandoned to wither on the vine because of the reluctance of those outside the area to help provide radio linking ?

> .... one of the justifications for allowing internet linking was to "breathe new life" into the UK packet network. Of course it hasn't done that

Agreed. The internet linking was happening previously to its 'allowance' by the RA. All the RA did was to ban internet linking, then make it available under NOV (Notice of Variation). Previously, any amateur could undertake wired linking operations under the terms of the 'self-provision licence' that was necessary to make everyday amateur radio operations legal again after the 1984 Telecommunications Act took effect. Out of fairness, the RA was persuaded to 'permit' internet linking by those who did not believe that the facility already existed, and who were concerned with linking voice repeaters rather than data.

> What I cannot understand is why anyone should think that using wire links to transfer messages should "breathe new life" into an amateur *radio* network.

I think we are quite rightly concerned that wired links will replace radio links. If we consider radio linking to be 'first and foremost' in our minds, and the use of wired links to be second fiddle, then the name of the game is to increase the role of radio links by bringing traffic on to them *that would not otherwise exist* over those wires.

> Why do UK amateurs still get a thrill out of exchanging a few sentences on 10m with a VK? Not because of the fact that they are talking to someone in Australia, they can do that any day on the telephone, it's because they're doing it on amateur *radio*.

I wholeheartedly agree, although I think contacts made via repeaters such as a local packet node do not count towards an individual's achievement in hitting any 'DX'. The achievement is in providing radio based networks as a cooperative activity, and the question is whether we are too proud to carry traffic over *radio* on those networks that has been sourced or transported previously by other means.

As radio amateurs, we may be against replacing radio links with wired links, but how about replacing wired links with radio links where possible ?

73, Gareth.

> Are you simply saying that since the BBS sysops only speak English and thus can not verify if the contents of a message written in a foreign language is legal and thus, complain about it ?

> Or are there really regulations stating that UK BBS messages must be written in English ?

There is no requirement for amateur radio messages in the UK to be in
English, although as in most countries, messages may not be sent that
are in secret code or cypher.

The problems usually arise either because intermediate BBS sysops have a
wider repertoire of words like 'sale' and 'selling' in other languages
than the importing BBSs do, or a small minority of sysops operate a
'positive proof' policy - where a message cannot definitely be proven to
have broken no rules because it cannot be understood, then it is
branded as 'illegal' and deleted.

Try AGWPE:

http://www.raag.org/sv2agw/inst.htm

This is a great piece of gear. I use the Sound Card interface
at both 1200 and 2400 baud. I only wish it had a 4800 baud
mode, but the next step up is 9600.

It also has the Baycom junk...

That would cause message duplication, but not message corruption.

Don't cut and paste the text into your mail, but attach it as a file.
Preferably use WinZip to compress it first.
When your mailer program still corrupts the text, remove it from your
system. It is broken beyond repair and unsuitable for any use.

Hi,

Just joined this newsgroup and can only see a handful of messages, so this
may have cropped up before.

I'm developing a Microsoft Visual C++ V6.0 MFC application for software
decoding of RTTY, ARQ, FEC etc via

1/   (Primarily) The bitstream input from Hamcomm-like comparator

2/   (Poss) Source is from audio-in to soundcard

Has anyone got knowledge of some low level VC++ code to 1) analyse and
decode the bitstream or 2) perform the FFTs for RTTY decode.

I have had a good look, but I've only got FFT for WinPSK and I'm not sure how to implement phase, frequency analysis of other COMn decodings for FSK systems.

TIA

Philip Cummings

Hi Brian,

Interesting... The problem is that it's like the com port isn't there. The radio doesn't get keyed for Tx, and when something is received, nothing appears at the bottom window.

BUT, based on your success I poked around a bit, and suddenly it started working. It seems like I had to do something to initialize the com port, because after looking at it with a diagnostic the radio sprang to life. But then it went inert again after a reboot.

Did you do something special with that com port to prepare it for use? Windows ini file or something?

Thanks for your help,

Greg.

I would like to change to audio output on my MFJ-178 to run on rtty at lower frequencies so I can use either a 1.2khz or (preferably) .5khz filter in my receiver. I have the manual, but in following the directions it shows a formula (525000/freq) + 1 to give it when you are in the calset mode. I can seem to adjust it by looking at a freq counter for the standard ssb filter freqs in the 2khz range, but when I compute the number for something in the 700 to 800 hz range it does not seem to move down that low. What am I missing? Or will it not move that low? It is the pits to try and copy stations with the 2.4khz filter in line.

Does anyone know if the KAM has always used "INT KISS", "RESET" to go
into KISS mode, or did the very early ones use different commands?

Joe,
It is my understanding that PSK31 is used on 2 M from 144.144 to
144.150. Ops in the west use 144.290, but that is close to a beacon in my
area. I have not heard of use on UHF frequencies. It would be interesting to
try bands higher than 2 M

Greetings,

I have recently had to send my rig off for a problem. When it arrived at the fixers, guess what it was working correctly.
Prior to it leaving I have been able to use RTTY via a PK232 using FSK mode. I have stuck the various connectors where they should be.
But for whatever reason it is now not working.

The connections I have are:
DIN pin1 - FSK center
DIN pin2 - FSK GND

Plus the usual conncector for audio in/out etc.

The receive side is fine on LSB but not on FSK, so I assume that the signal is there. If I transmit in LSB/USB mode, the transmitter keys up fine, but the audio level is unreadable (Monitor mode.)
In FSK mode I can receive nothing, but I am, I'm told, putting out a carrier.

TS870 settings:
Menu 62 - 170 FSK
Menu 63 - off (Mark Pol) Tried it both ways.
Menu 64 - 2125 (FSK tone)

Can someone confirm the various wiring setups for said configuration. So that I may check them all out.

Is there some setting which has gone completely out of my mind, easy done these days.....GRIN.

Any help much appreciated.

I've checked all that I can think of....

73 de Kevin

What's wrong? No transmit? No receive? Really, I totally sympathize.
More than once, I've torn everything apart, and checked everything, and
it turned out to be something stupid.

I am in a hurry to get out at the moment but....if you are using the EU
version of the PK232 then you should set the FSK tones in the TS870 to
the 1275 setting.
More later

Maybe there is a loose screw or washer floating around in the unit?

     Are there any mobiles (or HTs) that can do 9600 baud pacsat?
I noticed the Kenwood TM-D700A says, "Satellite packet ready",
but it looks a bit bulky and expensive.
Seems to me that they need at least 3 things:

1. 9600 baud
2. 2m/70cm full duplex (separate antenna connectors would be nice)
3. fairly fine frequency control to compensate for doppler

     I noticed that the Alinco DJ-G5TH (HT) says, "full duplex".
I suppose this is designed for the AO27.
```

The Yausu FT90R says, "9600 baud". It looks real small
and is not too expensive.

Please elaborate. The decision is a binary one: either a sound
card works with PSK31, or it doesn't. If it doesn't, you either
try different ones until you find one that does, or you trouble-
shoot the problem and fix it yourself. FUD is unnecessary.

Twpsk's use of the sound card is completely vanilla. Maybe
I've been lucky, but every sound card I've ever plugged in to
my PC has worked with every application I've ever tried.

My baseline apps, in case you're curious, are twpsk, wavrec/
wavplay, timidity (for midi) and amp (for MP3s). If one

works, they all work. Which stands to reason, since they all
access the sound card through the same interface. My current
sound card is a Crystal-based cheapie. It works with everything
I've tried, but the setup is non-trivial: you have to configure
the Plug and Play stuff, then you have to load the right modules
with the right parameters. It's all documented, and it works.

I have considered updating the (somewhat antiquated) drivers
for some of the nice newer (e.g. SB 128 PCI) sound cards. A PCI
interface can do some very nice things. Some day I may
actually get around to it...

I hardly feel this is FUD. You are losing track of the fact that we were NOT just discussing Linux programs. You also forgot option C; try a different application program, which is what worked under Microsoft Windows98 in this case.

Yes, you've been lucky. So the Linux driver is not 100% functional with this one particular card. I think I stated that about 3 posts back as a reason to avoid "the latest and greatest hardware" since sometimes it takes a while for driver support to catch up.

Of course, if you are the sort that enjoys driver hacking, go for it.

> My baseline apps, in case you're curious, are twpsk, wavrec/
> wavplay, timidity (for midi) and amp (for MP3s). If one
> works, they all work. Which stands to reason, since they all
> access the sound card through the same interface. My current
> sound card is a Crystal-based cheapie. It works with everything
> I've tried, but the setup is non-trivial: you have to configure
> the Plug and Play stuff, then you have to load the right modules
> with the right parameters. It's all documented, and it works.

And as I have stated before, I have little use for the sound card under Linux (or Windows for that matter) and have tried nowhere near enough different applications to fully execise ALL capabilities of the driver under either OS.

I have no doubt were I to go on sound safari, I would find other things that don't work with this card and the current driver.

I use the AGW Packet Engine. The latest version has great sensitivity
and has the added plus of working both 2400 and 1200 baud packet
on the same channel.

http://www.raag.org/sv2agw/agwpe.zip

With UI-View32 you choose Setup->Comms Setup and select
AGWPE.

Under the AGW icon you go to Properties and add two ports (a 1200
and a 2400 one) then select one of the ports and select OK, and you
will be able to select TNC type to Soundcard and Dualport.

Works fine, lasts a long time...

Hi I would be interested to hear from people who have sucessfully set up packet radio using the sound card as a modem.

I am interested in promoting packet radio and also APRS reception in our area.
Many potential amateurs own scanners and computers equiped with sound cards.
I would love to try and put together a disk that cound be distributed in the hopes of further promoting interest in amateur radio.

Please feel free to contact me if you can help in any way?

area's.

- Setting up UIview to RX APRS using a sound card?

- Setting up UIview using a sound card under Win 3.11?

- Setting up packet radio (Say TSTHost) using a sound card.

Consideration should be given to the fact that many people still use older computers like 486's and WIn 3.11. Will these support the sound card drivers?

Any help appreciated! In an effort to further promote amateur radio to new commers.

Reagards,
Ken.

I have been playing with MT63 for only a few days. Have made two contacts, but both were in the 500 mile range. Am looking for other stations, but what are the operating frequencies. I have scanned all the hf bands but that is a hit-and-miss effort. What a wild mode!

It might also be that it is more useful as a HF mode than VHF/UHF...

"more useful" ??

As a 2m SSB (not FM) audio source, it provides as much fun
as on HF. I'm always surprised at what I hear on the 2m band,
and if you get off the repeaters, you may find it quite enjoyable
again.

That's all the more useful any of it get's. Remember, we are
hobbyists looking for fun, not engineers looking for a new
product, or sales gimmick.

Hi Joe,

I conducted few experiments last year. PSK31 coped pretty well with the deep fading which can be experienced on VHF but the major problem seemed to be drifting of Fx with the two stations. PSK31 would track this while receiving OK but after a couple of overs the stations operating Fx had drifted apart far enough to have to keep retuning manually.

On checking the specs for my IC821H I see the frequency stability is +/- 3ppm so I guess this could give a worst case of 3x145 (approximate Fx in MHz) = 435 Hz as the rig temperature increased during long overs. Not very noticeable on SSB but a lot compared with the very narrow bandwidth of PSK31.

My conclusion may be wrong but the problem of staying in tune was a real headache :(

If you manage a 2m contact I would be interested to see if you notice the same sort of problem.

Hello Roger:

IN KISS has always been the command as far as I know. (at least from 3/93 on)

IN NEWUSER|TERM|BBS|KISS|HOST are the different parameter settings for the INtface command. If you need a description of each of these settings, feel free to email me.

If you need additional KAM commands I have about 30 or so listed on our website http://home.beseen.com/hobbies/meritgroup/

Hello,
I am looking for information and a download source for the MFJ macro files that can be used to customize the program Logger for use with the 1278B. I have heard that these are available for download on the Internet, but have had no luck locating them. Any assistance would be greatly appreciated.
Thanks and 73,
Patrick KB0BRO

I want to start using PSK31. Most of the software I've seen says that you need a "100 MHz class" computer. The computer I have dedicated to ham radio is a 75 MHz Pentium. Will the software just run a bit slower on this machine or will it not run at all? If it just runs a little slower, is that a big problem?

Thanks.

H Paul. I don't know of any newsgroups, but it might be a good one to
start. You do know about the NWAPRS and UI-View mail lists don't you?
There's also the tapr list, but it's too busy for me to keep up with..

While there's a lot more to it than what you ask, the program DX4WIN does
exactly what you ask. It interfaces to a printer port (parallel) to
generate the keying signal. But, then, he might find the logging feature
easier than writing. It also supports a number of popular rigs (Icom,
Kenwood, Yaseu among them) for tuning.

http://www.dx4win.com

UI-VIEW I forgot about, thanks.  Didn't know about the other one.

Thanks Clint, talk to you soon.

Paul.

There are some very active mailing list reflectors
dealing with APRS at TAPR, see www.tapr.org for details.

Basically and windows sound card will work, nothing special needed, I have a
17 dollar card that works perfectly.

As long as you use windows related software and this software uses the windows sound drivers, all cards will work fine. But some software (running in msdos f.e.) can use only real soundblaster cards.

PS : If you still need to buy a soundcard, considder that a card with a line-in and line-out is a better choise than a card only with a mic-in and speaker-out.

I use both CWGet and CWType. CWGet runs in W95/98/2000 or NT and uses the windows sounndcard. Just put your receiver's speaker-out or line-out and run it into the lin-in or mic-in of the PC soundcard.
CWType uses the DTR signal on a serial port to really key the CW keyer of the tranceiver. You just need to make a DB-9 or DB-25 connector and use ground + the DTR line to the cw-keyer jack.

GWType is free, CWGet is shareware (can be used but all settings can not be saved until registration)
take a look at http://www.dxsoft.com/

The only worthwhile PSK or other soundcard software available to day for
the INTEL platform is windows software. This is NOT an issue.

True but easy to get around with simple interface adjustments.
The best criteria for a sound card is price, IF , you are not using it for
music.

   Really? That's odd. I guess I must be imagining all of the
PSK contacts I've been having using Linpsk and twpsk, under Linux.

???

Like others, I must be imaginingg all the PSK31 and other stuff
I'm doing with a sound card under Linux.

For applications like this, the cheaper the better. Cheap sound
cards don't come with all those surround 3D gimmicks - which
may make games sound better, but which raise hell with DSP
applications.

Mine was the cheapest I could find at the computer store on
a Saturday afternoon. ISA, Crystal chipset, $CDN19.00. It
works fine. I didn't bother with amplified speakers: a quick
trip to the local thrift store produced an antiquated but
serviceable stereo amplifier, and a couple of speakers to
hook up to it.

They will all work the same with one caveat; the latest and greatest high end card out may not work with all PSK packages. Unless you are a music freak, you probably don't need the latest and greatest anyway.

I am using an old, small "Car radio booster". It fits in a 5.25 bay (with some extra mounting hardware) and I power it from the PC power supply.

I removed the loading resistors from the input, and now it works perfectly on the line level output of the soundcard.

```
Connected a pair of cheap speakers to it, and the result is much better
than with the average PC speaker set.  For real Hi-Fi work I connect the
line out to my music system, and turn off the booster.

Can you explain why that is?
Are drivers for the latest and greatest high end cards not compatible with
normal soundcard drivers?

Maybe, maybe not.

The sound card makers add new and "better" features to their cards; these new features may cause problems with software that accesses the card at a low level; i.e. DSP software as in PSK applications.

Keep in mind that most PSK software packages come from people writing them as a labor of love and not as a commercial project. This implies they probably do not have access to all the myrid sound cards on the market to do testing. So if some new card comes out that works just a bit differently and the software breaks, they will probably not find out about it until some user reports the problem.

Case in point; I have a machine that will not run digipan or winpsk, but runs winwarbler just fine. The card works under win98. It doesn't run right with twpsk under Linux (it is a dual boot machine) either. I forget which card it is, but it is a pretty new card from Creative.

If I were putting together a machine just for PSK and such, I'd go buy the cheapest thing I could find.

So, are you saying that you can not talk directly to hardware under windows?

Last time I did any windows programing (admittedly years ago) you could.

Not that doing this is such a good idea, since it leads to precisely the type of problem we are talking about.

In any case, I have no idea what the problem is under windows. It has the makers drivers installed. And the latest updates from the maker. Of the three PSK programs I've tried, 1 worked, 2 didn't, no problems with any other windows app.

>> So if some new card comes out that works just a bit differently
>> and the software breaks, they will probably not find out about it
> until some

Probably, no quibble there. But that doesn't solve the problem for an end
user.

>> Case in point; I have a machine that will not run digipan or winpsk,

> What goes wrong with the Windoze programs? Can you record or
> play back other sounds?

Everything else under windows seems to work fine. One PSK program (I forget
now which did what) acts like there is no input and the other locks up
and has to be killed with CTL-ALT-DEL when you try to transmit.

> What goes wrong with twpsk? I'm familiar with the source, and
> know that doesn't do anything fancy with the soundcard -
> /dev/dsp and ioctl(). Can you record or play back other sounds?

It works with xawtv and will play audio CDs; that's my limit of interest
in sound under linux on that machine; background noise while doing something
else.

I have no doubt the Linux problem is the driver doesn't fully support the
card. Twpsk works just fine on a different Linux box with an older card.

> The "cheaper is better" rule remains a good one, but not for

> without messing with them.

In this case, from experience, I have to disagree. No matter the base cause,
i.e. broken driver or direct hardware calls, it is more likely that last
months card will be fully supported (or the driver fixed) than next months
card.

I looked at the source and didn't see where it used /dev/dsp. What am I missing?

The other stuff is addressed in the news reply.

There is only one level applications use: the interface provided by the OS - /dev/dsp under Linux, the MM calls under Windoze. If those fail then the driver is broken and must be fixed.

> So if some new card comes out that works just a bit differently
> and the software breaks, they will probably not find out about it until some

If they are using the documented sound card interface then the driver is broken.

What goes wrong with the Windoze programs? Can you record or play back other sounds?

What goes wrong with twpsk? I'm familiar with the source, and know that doesn't do anything fancy with the soundcard - /dev/dsp and ioctl(). Can you record or play back other sounds?

```
The "cheaper is better" rule remains a good one, but not for
software compatibility, a non-issue. Cheap sound cards are
more likely to just record the samples and play them back,
without messing with them.

xawtv and playing audio cd's (presumably using a CD player with analog
output and cable running from the player to the soundcard) are an entirely
different class of problem...

In these cases, only the "mixer" (volume control) of the soundcard is used,
not the A/D and D/A converters.  No driver software is involved except for
setting the volume level, and this may even be at its default level.

Even when IRQ and DMA are not setup or set to conflicting values, this
mixer will still work.
So this tells little about the driver functionality.

A bit better would be to use a DAE tool to get a track from the CD into a
file, and then play that file.  That would go via the soundcard D/A.

Rob

#1 - VERY BRIEF INTRODUCTION

Due to an enormous client list, I can only take serious applicants at this time. I am offering a full or part-time position in processing e-mail. You can work at home. I do require that you have a computer and are familiar with internet/e-mail functions. As to the salary it's totally up to you. You will be running your own business, the sky is the limit. What you will see represents a totally legal money making business that anyone can generate a significant residual income.

You will receive full instructions, and I will always be available to help you and answer your questions. This is a genuine home business. This is not a chain letter, money game, telecom scheme, or any of the multitudes of dubious "business" offers that come through your e-mail box. This business will generate a residual income of $2,000 to $6,000 every month with only part-time commitment (about 10 hours a week).

A full time commitment (about 30 hours a week) based on statistics gathered from associates world wide, will translate into an income of $10,000 or more per month!

To prove my confidence and sincerity in this opportunity, there is NO CHARGE to join us for the first month. You will receive all information to get started plus the first month's information package ($90 value). If by remote chance you are not satisfied with the program after the first month and want to discontinue, you may by all means do so and I will not contact you again.

But on the other hand, if you are satisfied with the program and wish to continue after the first month, that is when you have to pay $90 for the next month's information package. Since you DO NOT pay anything until after you are already earning an incredible residual income, you have absolutely nothing to lose.

IMPORTANT!

If the above opportunity interests you in the least, and you would like more specific information about our business please contact me at adenby@consultant.com and type in the SUBJECT LINE: "FORWARD PROJECT 21 INFO". Insert your full name, your correct e-mail address, and any specific questions you may have at this time in the body of the message.

We are successful only if YOU are successful, and therefore we will do everything in our power to ensure that your relationship with us is a profitable and successful one. I look forward to your response.

Sincerely,
Angela Denby

> What am I missing?

Because, having just re-checked the source code, it uses
/dev/audio - look at the routine init_audio() in server-main.C.

None of which changes anything: it uses the OS-defined interface
to the sound card, and it uses it the way it's supposed to. If
that doesn't work, there is something wrong with the driver.

Direct hardware access under Linux requires root privilege.
The only examples I've ever come across are programs that use
SVGAlib and its ilk. My own weather satellite program is
an example...

Not quite true. We are ALL oversimplifing the problem (myself included).

> A bit better would be to use a DAE tool to get a track from the CD into a
> file, and then play that file. That would go via the soundcard D/A.

The card will play sound files and will play audio from mpeg video files.

OK, now what? Are you volunteering to to delve into the workings of the Linux sound drivers and/or twpsk's use of them?

Reply-To: Roger Barker <roger@peaksys.fsbusiness.co.uk>
Newsgroups: rec.radio.amateur.digital.misc

I've just looked at the bulletins that have arrived today on my local packet mailbox. There for my "enjoyment" are parts 1, 5, 15, 17, 18, 23, 27, 29, 33, 37, and 38 of a 40 part 7plus set from an HB9 station. They're all more than 10kb in size, so there's a nice 100kb or so of pure junk for the users to read. Yes, I know that in theory the other 29 parts might arrive, but in practice I know that the possibility is nil.

All over the UK there will be other packet mailboxes carrying this same completely useless junk, and many other examples of the same sort of thing.

In their journey to the UK, these 11 parts of 7plus have twice travelled via the telephone (aka internet links). On the second occasion it was done to span a gap of less than 50 miles between two UK mailboxes.

So, we have a mailbox network carrying large amounts of absolutely useless traffic, increasingly relying on non-radio links to carry it! No wonder the users go away! A packet mailbox network is irrelevant in the world of modern communications unless -

(a) It uses amateur radio.
(b) It carries useful traffic of interest to radio amateurs.

Why is it that an increasing number of mailbox sysops are unable to
appreciate that simple fact?

OK, I'll buy that. I didn't think there was a direct reference to /dev/dsp
in the code.

I agree. The whole point is (was) the latest and greatest hardware may not
have 100% bug free driver support, no matter the OS. That seems to be the
case with this particular card. Is this surprising to anyone?

> Direct hardware access under Linux requires root privilege.
> The only examples I've ever come across are programs that use

Again I agree. The direct hardware access reference was for windows, not
Linux.

Got an old Tiny2 (10years old firmware)

It will accept the first parameter command at the command prompt
ie

myc
this returns
myc gi4lkg

if i then try a second parameter (any parameter) ie

txd

I get a
invalid command

I have removed the battery for a long time.......sent a RESET and a RESTART command but still the problem exists............

Do you know of this fault and the FIX?

Please help

Thanks de Victor gi4lkg@qsl.net

This cannot be the only factor. People move amounts of data much larger
than 100K through their telephone modems just for purposes of appearance,

like a page background and some decorations on an average webpage.

When the existance of 100K of useless data really bothers you, there must be an underlying problem of a network incapable of carrying such amounts of data without you (and other observers) getting worried about efficiency of usage.

This problem has plagued packet radio right from the start: the capacity of the system was too limited to be able to tolerate any overhead for which the observer does not see the immediate need. It has been R: headers, TCP/IP headers, 7+ overhead, you name it. Anything above basic message content. All attempts to have extra functionality in the network have been welcomed by few and detested by many others, because of efficiency.

This hasn't really improved over the years, but the expectations of computer users have. Users want to be able to internetwork, to send photographs in JPG format, to attach PDF files to their message, to distribute software. But the packet network has failed to deliver these features. So users move to a network that does.

Rob

Easy Money for just one $10.00 bill and one stamp !!!!$$$$
WHAT HAVE YOU GOT TO LOSE???

BY READING THIS YOU COULD CHANGE YOUR ENTIRE LIFE FOREVER!!!
[now you will find US $10.00 bills in your mailbox !!!!! (NOT JUST 1$ BILLS)

! $31,250.00 in 4 weeks!!!!!!!!!

I found this on a bulletin board and decided to try it. A little while back,
I was browsing through newsgroups and came across an article similar to this
that said: you could make thousands of dollars within weeks with only an
initial investment of one $10.00 bill!!!!
So I thought, "Yeah right, this must be a scam", but Like most of us,
I was curious, so I kept reading. Anyway, it said that you send only
one US $10.00 bill to the first address in the list below
You then place your name and address in the bottom of the list at #3,
and post the article in at least 200 newsgroups. (There are thousands)
No catch, that was it.
So after thinking it over, and talking to a few people first, I thought
about trying it. I figured: "what have I got to lose except only
one stamp (not six) and only one $10.00 bill (us fund), right?"
Then I invested the measly $10.00 .

Well !!.GUESS WHAT.. within 7 days, I started getting money in the mail!
I was shocked! I figured it would end soon, but the money just kept
coming in. In my first week, I made about $250.00. By the end of the second
week I had made a total of over $1,000.00! In the third week I had over
$10,000.00 and it's still growing.
It's certainly worth a $10.00 used bill, and only one stamp,
I have spent more than that on the lottery!!

Let me tell you how this works and most importantly, why it works...
Also, make sure you PRINT a copy of this article NOW, so you can get the
information off of it as you need it. I promise you that if you follow the
directions exactly, that you will start making more money that you thought
possible by doing something so easy!

Suggestion: Read this entire message carefully!
(print it out or download it to your hard disk.)
Follow the simple directions and watch the money come in!
It's easy. It's legal. And, your investment is only one $10.00 US bill
(plus postage, only one stamp (not 6 , so the global cost will be a bit more
than 6 letters with $1 in each , but the amount of money you win
will be much more... and your wealth will be all made with thousands of
$10.00 bills ...... not $1 bills as other programs).

IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal;
and it is virtually no risk - it really works!!!
If all of the following instructions are adhered to, you will receive
extraordinary dividends.

PLEASE NOTE: Please follow these directions EXACTLY, and $30,000 or
more can be yours in 20 to 60 days. This program remains successful because
of the honesty and integrity of the participants.
Please continue its success by carefully adhering to the instructions.
You will now become part of the Mail Order business. In this business your
product is not solid and tangible, it's a service. You are in the business
of developing Mailing Lists. Many large corporations are happy to pay big
bucks for quality lists. However, the money made from the mailing lists
is secondary to the income which is made from people like you and me asking

to be included in that list.

Here are the 4 easy steps to success:
STEP 1: Get a piece of paper or a postcard and write the following on it "PLEASE PUT ME ON YOUR MAILING LIST." , your name and address.
Now get one US $10.00 bill and place it into a dark paper(opaque) so the bill will not be seen through the envelope (to prevent thievery) .
Next, place the paper or the postcard and the dark paper with the $10.00 bill in it into the envelope and seal it (please seal it very well).
What you are doing is creating a service.
This is absolutely legal. You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal!
Mail the envelope to the first address in the list below:
(you send one $10 bill to the first name only)

1.)Oueslati abdellatif
B.P. 86/B , 3100 kairouan,
Tunisia

2.)David Camillier
B5-6900 crabapple drive
Whistler, B.C. V0N 1B6
Canada

3.)Jeffery Vincent
P.O. Box 46
Mittie, LA 70654

STEP 2: Now take the #1 name off the list that you see above, move the other names up (3 becomes 2, 2 becomes 1,) and add YOUR name as number 3 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to the original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups.) All you need is 200, but remember, the more you post, the more money you make!
This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1241 of the Postal lottery laws.
Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again.
PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way, if you are of integrity, the program will continue and the money that so many others have received will come your way, too.

NOTE: You may want to retain every name and address sent to you, either on

a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service.
(Also, it might be a good idea to wrap the $10 bill in dark paper to reduce the risk of mail theft. You can send a postcard with the dark paper and use a thick envelope)

Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousands of dollars in CASH!!!

What an opportunity for only one $10.00 bill!

Send it now, add your own name to the list and you're in business!

---DIRECTIONS----FOR POSTING TO NEWSGROUPS------------------

STEP 1: You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document, and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory. If you are having trouble then start by clicking your cursor on the beginning of this letter while continuing to hold down the click button of your cursor. As you do this drag the cursor "all the way down to the bar" and past if need be at the bottom of your viewing screen. Try it and you'll see .

STEP 2: Open a blank 'notepad' file and place your cursor at the top of the blank page. From the 'edit' menu select 'PASTE'. This will paste a copy of the letter into notepad so that you can add your name to the bottom of the list and to change the the numbers of the list.

STEP 3: Save your new notepad file as a '.txt' file. If you want to do your postings in different settings, you'll always have this file to go back to.

STEP 4: Use multiple search engines like
www.dogpile.com/ or www.metafind.com/ to search for various usenet newsgroups (on-line forums, message boards, chat sites, discussions).
If you are having trouble finding any then go on and try www.reference.com/ or www.liszt.com/ or www.forumone.com/ as examples to look in.
You may also wish to tell future readers from around the world that they can read this letter in another language if they visit
http://babelfish.altavista.com/cgi-bin/translate or by going to
www.altavista.com/ and clicking on "AV Tools & Gadgets" and then click on "AV Translation Service".

STEP 5: Visit these message boards and newsgroups and post this article as a new message by highlighting the text of this letter and selecting 'PASTE' from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings in a particular group, click the post message button. You're done with
your first one! Congratulations... That is it! All you have to do is jump to different newsgroups and post away. After you get the hang of it,
it will take about 30 seconds for each newsgroup!

** REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!!
BUT YOU HAVE TO POST A MINIMUM OF 200** That is it!
You will begin receiving money from around the world within days!
You may eventually want to rent a P.O. Box due to the large amount of
mail you will receive. If you wish to stay anonymous, you can invent a name
to use, as long as the postman will deliver it.
JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.

Now the WHY part:
.Out of 200 postings, every letter will be seen by hundreds of people but
say that only 5 will participate (a very low example).

So then your name will be posted :
by 5 people at the #3 position
(if every one sending 200 postings refers 5 persons)
your name will be posted by
(5*5) = 25 people at the #3 position
(25*5) = 125 people at the #2 position
(125*5) = 625 people at the #1 position

When your name reaches the first position in a few days, it will be your
turn to collect your $10.00 bills
Now you will receive moooooooooney!!!!!!!

and if just only 5 persons per 200 reply, your name will be out of the list
by
625 * 5 = 3125 persons and everyone will send to you a $10.00 bill,
so you will get

3125 envelopes * $10 = $31,250.00 !!!!!

(10 times more than other $1 programs with
the same number of letters in your mailbox).
AMAZING !!!!!!

$31,250.00!! With an investment of only $10.00!

**You may want to save this page to your hard drive for future use.
The More Times You Re-start THIS group, with your name added last
sending $ 10.00 to the first address and posting again
- everyone listed in THIS group is also started over.
This is why this program is better than others - it never stops!!!!

The thing to remember is: do you realize that thousands of people all over
the world are joining the internet and reading these articles everyday?
JUST LIKE YOU are now!!
So, can you afford a US $10.00 bill and see if it really works?? I think
so...
People have said, "what if the plan is played out and no one sends you the
money?
So what! What are the chances of that happening when there are tons of new

honest users and new honest people who are joining the internet and
newsgroups everyday and are willing to give it a try? Anyway,
it is only $10.00 for a chance at thousands.
Estimates are at 20,000 to 50,000 new users, every day, with thousands of
those joining the actual internet.
Remember, play FAIRLY and HONESTLY and this will really work.
You wouldn't want someone to cheat you the same way you may be cheating!
Yours sincerely,

Jeffery Vincent

Etc...

I'm sorry, but you have missed my point. This data is truly useless. It is incomplete 7plus. It will never all arrive. Not only that, but the parts that have arrived have errors in them. This sort of thing has become very common now on the UK network with the increased used of internet linking.

Of course people move large amounts of data via modems, but what has that got to do with amateur *radio*? Absolutely nothing.

Most amateurs in the UK now have internet access. They don't need to use packet. If they want to receive a large program file, they can use the internet. Packet only has any relevance because it uses amateur *radio*. If you remove the amateur *radio* element it has no relevance. That is the problem - the more internet links are used on the packet network, the less important the amateur *radio* aspect becomes.

>When the existance of 100K of useless data really bothers you, there must

>of usage.

I'm not worried about efficiency of usage. Most of the UK network uses 1200 baud links, and many of them are very poor. Over the years I have learnt to accept that our network will always be inefficient. I am worried by the replacement of radio links with internet links, and I am worried by mailboxes being filled with what is completely useless data. It really is not very attractive to users to list the messages on their local mailbox and see a long list of useless 7plus parts.

Being a hobby, you get all kinds of users. Most of the sophisticated packet users have moved on to more interesting things, and that leaves only the die-hards and pre-teens.

But I agree, the evidence you list has caused 100's of users to sell their equipment. Most sold off about 5 years ago, however, so your message is a little late.

I feel really sorry for you that you guys still have not gotten a network which transfers BBS bulletins without error...
This was a problem here a decade ago, but once everyone switched to F6FBB BBS, it was a thing of the past.

Corrupted messages are caused by:
- use of badly designed hostmode protocols (DED, KISS etc) which forget that the link between TNC and PC has to be checksum-validated as well
- use of network nodes that damage packets in transit, either because of the use of KISS or because of other design problems
- use of oldfashioned forwarding protocols (RLI/4RE) which don't perform end-to-end checksumming of transferred messages
- use of unreliable equipment that damages messages while stored in the BBS.

The latter should not cause really frequent corruptions, but the combination of the first two does. Once end-to-end checksumming is in place, corrupt messages are replaced by missing messages or inefficient repetitions during forwarding. When a proper interface between PC and AX.25 is in place (an SCC card with proper driver software is an example) this problem is gone as well.
I have not tried it for a year or two, but at the time I last tried, we did not see this "corrupted 7+ message" problem anymore for messages that travelled through systems with reasonable design.

That messages would get corrupted on Internet links really baffles me.
I transfer multi-megabyte files over the Internet routinely and rarely ever see a corrupted bit.

>I'm not worried about efficiency of usage. Most of the UK network uses

>It really is not very attractive to users to list the messages on their
>local mailbox and see a long list of useless 7plus parts.

Then run a server that collects the 7plus parts into downloadable binary files, and hides them from the listings seen by users. Has been done for years here, and it works. The local BBS also runs a server that allows a user to set a list of accept/reject patterns for messages to appear or not appear in a listing. That way a user can see the interesting topics without being bothered by the useless crap. Imagine what usenet would be if everything was in one newsgroup, and there were no killfiles!

Any information system will always have things you are interested in and things you consider useless. You are not going to fix this by complaining or educating others, partly because the view about what is useful and what is crap differs from person to person. Others may be interested in the 7+ parts to analyze what caused them to be broken so badly, and where that happened (just to give an example).

So, it is better to fix it by improving the user interface.

Rob

Not over here. Our network is only just starting to seriously decline.
But then it's only fairly recently that we have been allowed to use
internet linking...

We do, of course, use FBB in the UK... I am surprised that you think using FBB is a fix for corrupted bulletins! Corruption usually results from operator errors, not software bugs.

>Corrupted messages are caused by:
>- use of badly designed hostmode protocols (DED, KISS etc) which forget that the link between TNC and PC has to be checksum-validated as well
>- use of network nodes that damage packets in transit, either because of the use of KISS or because of other design problems

>- use of unreliable equipment that damages messages while stored in the BBS.

And the use of modem links...

>That messages would get corrupted on Internet links really baffles me.
>I transfer multi-megabyte files over the Internet routinely and rarely ever see a corrupted bit.

Perhaps you do it correctly... Do you read any of the FBB mailing lists? If you do, you must be aware that there are now lots of mailbox operators who don't properly understand the basic fundamental principles of how their mailboxes work, but they are operating internet links. Recently on the UK network there was an "AX25 versus TCP/IP" discussion. The lack of knowledge shown by some of the mailbox operators was quite amazing, but some of them operate internet links. Etc...

>Any information system will always have things you are interested in and things you consider useless. You are not going to fix this by complaining or educating others, partly because the view about what is useful and what is crap differs from person to person.

My point was that, to the average mailbox user, broken 7plus sets aren't interesting. Also, seeing piles of useless junk being passed round from mailbox to mailbox really does make people think "What has this got to do with amateur radio?".

> Others may be interested in the 7+ parts to analyze what caused them to be broken so badly, and where that happened (just to give an example).

That's true, but not the majority of users.

Subject: $6 Deal=20

Date: 10-01-2000=20

Poster: Railsplitter

Message=20

A while back, I was browsing these newsgroups, just like you are now,=20

and came across an article similar to this that said you could make=20

thousands of CASH within weeks with only an initial investment of=20
```

$6.00 plus stamps! So I thought, "Yeah, right, this must be a scam!"=20

But like most of us I was curious and kept reading. It said that if=20

you send $1.00 to each of the 6 names and addresses listed in the=20

article, you could make thousands in a very short period of time. You=20

then place your own name and address at the bottom of the list at #6,=20

and post the article to at least 300 newsgroups. (There are about=20

32,000 of them out there and that's quite a large market pool). No=20

catch, that was it. Even though the investment was a measly $6, I had=20

three questions that needed to be answered before I could get involved=20

in this sort of thing.=20

1. IS THIS REALLY LEGAL?=20

I called a lawyer first. The lawyer was a little sceptical that I would=20

actually make any CASH but he said it WAS LEGAL if I wanted to try it.=20

I told him it sounded a lot like a chain letter but the details of the=20

system (SEE BELOW) actually made it a legitimate legal business.=20

2. IS OK WITH THE POST OFFICE OR IS IT MAIL FRAUD? I called them:=20

1-800-725-2161 and they confirmed THIS IS ABSOLUTELY LEGAL! (See 18,=20

h sections1302 NS 1341 of Postal Lottery Laws). This clarifies the=20

program of collecting names and addresses for a mailing list.=20

3. IS IT RIGHT? Well, everyone who sends me a buck has a good chance of=20

getting A LOT of CASH ... a much better chance than buying a lottery=20

ticket!!!=20

So, having these questions answered, I invested EXACTLY $7.92 ... six=20

$1.00 bills and six 32 cent postage stamps ... and boy am I glad I did!=20

Within 7 days, I started getting CASH in the mail! I was shocked! I=20

figured it would end soon and didn't give it another thought. But the=20

CASH continued coming in. In my first week I made between $20 to $30.=20

By the end of the second week I had a made a total of $1,000.00. In the=20
third week I had over $10,000.00 and it was still growing. This is now=20
my fourth week and I have made a total of just over $42,000 and it's=20
still coming in ..... It's certainly worth $6.00 and 6 stamps !!!=20
Also, make sure you print a copy of this article NOW, so you can get=20
the information off of it as you need it. I promise you that if you=20
follow the directions exactly, that you will start making more CASH=20
than you thought possible by doing something so easy!=20
Suggestion: Read this entire message carefully! (print it out or=20
download it.) Follow the simple directions and watch the CASH come in!=20
It's easy. It's legal. And your investment is only $6.00 (plus postage)=20
IMPORTANT: This is NOT a rip-off; it is NOT indecent; it is NOT=20
illegal; and it is virtually no risk - it really works!!!! If all of=20
the following instructions are adhered to, you will receive=20
extraordinary dividends.=20
PLEASE NOTE:=20
Please follow these directions EXACTLY, and $50,000 or more can be=20
yours in 20 to 60 days. This program remains successful because of the=20
honesty and integrity of the participants. Please continue its success=20
by carefully adhering to the instructions. You will now become part of=20
the Mail Order business. In this business your product is not solid and=20
tangible, it's a service. You are in the business of developing Mailing=20
Lists. Many large corporations are happy to pay big bucks for quality=20
lists. However, the CASH made from the mailing lists is secondary to=20
the income which is made from people like you and me asking to be=20
included in that list.=20

Here are the 4 easy steps to success:=20

STEP 1: Get 6 separate pieces of paper and write the following on each=20 piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00=20 bills and place ONE inside EACH of the 6 pieces of paper so the bill=20 will not be seen through the envelope (to prevent thievery). Place one=20 paper in each of the 6 envelopes and seal them. You should now have 6=20 sealed envelopes, each with a piece of paper stating the above phrase,=20 your name and address, and a $1.00 bill. What you are doing is creating=20 a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate=20 service and you are paying for it! Like most of us I was a little=20 skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal! Mail the 6 envelopes to the following addresses:

#1) M. Weber=20
801 Oaklands Dr=20
Round Rock, TX 78681=20
#2) S. Patti=20
1808 Ponderosa St.
Cocoa, Fl.,32926
#3) Gill=20
58 Moross
Mt. Clemens Mi. 48043=20
#4) Ryan Dick
7603 Canyon Dr.
Meridian, ID 83642

#5) Y.S.

2702 A Jenner Dr.

Baltimore, MD 21209

#6) D. Sims

905 Burning Bush Drive

Loganville, GA 30052

step 2: Now take the #1 name off the list that you see above, move the =
other=20

names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as number =
6 on=20

the list.

STEP 3: Change anything you need to, but try to keep this article as=20

close to original as possible. Now, post your amended article to at=20

least 300 newsgroups. (I think there are close to 32,000 groups) All=20

you need is 300, but remember, the more you post, the more CASH you=20

make! This is perfectly legal! If you have any doubts, refer to 18=20

Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these=20

steps for yourself and, whenever you need CASH, you can use it again,=20

and again.=20

PLEASE REMEMBER that this program remains successful because of the=20

honesty and integrity of the participants and by their carefully=20

adhering to the directions. Look at it this way. If you are a person=20

of integrity, the program will continue and the CASH that so many=20

others have received will come your way.=20

NOTE: You may want to retain every name and address sent to you,=20

either on a computer or hard copy and keep the notes people send you.=20
This VERIFIES that you are truly providing a service. (Also, it might=20
be a good idea to wrap the $1 bill in dark paper to reduce the risk of=20
mail theft.) So, as each post is downloaded and the directions=20
carefully followed, six members will be reimbursed for their=20
participation as a List Developer with one dollar each. Your name will=20
move up the list geometrically so that when your name reaches the #1=20
position you will be receiving thousands of CASH in CASH!!! What an=20
opportunity for only $6.00 ($1.00 for each of the first six people=20
listed above) Send it now, add your own name to the list and you're in=20
business!=20

---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS=20

Step 1) You do not need to re-type this entire letter to do your own=20
posting. Simply put your cursor at the beginning of this letter and=20
drag your cursor to the bottom of this letter, and select 'copy' from=20
the edit menu. This will copy the entire letter into the computer's=20
memory.=20

Step 2) Open a blank 'notepad' file and place your cursor at the top=20
of the blank page. From the 'edit' menu select 'paste'. This will paste=20
a copy of the letter into notepad so that you can add your name to the=20
list.=20

Step 3) Save your new notepad file as a .txt file. If you want to do=20
your postings in different settings, you'll always have this file to=20
go back to.=20

Step 4) Use Netscape or Internet explorer and try searching for=20
various newsgroups (on-line forums, message boards, chat sites,=20

discussions.)=20

Step 5) Visit these message boards and post this article as a new=20

message by highlighting the text of this letter and selecting paste=20

from the edit menu. Fill in the Subject, this will be the header=20

that everyone sees as they scroll through the list of postings in a=20

particular group, click the post message button.=20

You're done with your first one! Congratulations...THAT'S IT! All you=20

have to do is jump to different newsgroups and post away, after you=20

get the hang of it, it will take about 30 seconds for each newsgroup!=20

**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE=20

MORE CASH YOU WILL MAKE!! BUT YOU HAVE TO POST A=20

minimum of 300**

That's it! You will begin receiving CASH from around the world within=20

days! You may eventually want to rent a P.O.Box due to the large=20

amount of mail you will receive. If you wish to stay anonymous, you=20

can invent a name to use, as long as the postman will deliver it.=20

JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.=20

Now the WHY part:=20

Out of 300 postings, say I receive only 7 replies (a very low example).=20

So then I made $7.00 with my name at #6 on the letter. Now, each of the=20

7 persons who just sent me $1.00 make the MINIMUM 300 postings, each=20

with my name at #5 and only 7 persons respond to each of the 7 original=20

7, that is another $49.00 for me, now those 49 each make 300 MINIMUM=20

posts with my name at #4 and only 7 replies each, I will bring in an=20

additional $343.00! Now, those 343 persons turn around and post the=20

MINIMUM 300 with my name at #3 and only receive 7 replies each, I will=20

```
make an additional $2401.00! OK, now here is the fun part, each of=20
those 2401 persons post a MINIMUM 300 letters with my name at #2 and=20
they each only receive 7 replies, that just made me $16,807.00!!!=20
Those 16807 persons will all deliver this message to 300 newsgroups=20
with my name at #1 and if still 7 persons per 300 Newsgroups react I=20
will receive $117,649.00! With an original investment of only $6.00!=20
And some stamps. AMAZING! When your name is no longer on the list, you=20
just take the latest posting in the newsgroups, and send out another=20
$6.00 to names on the list, putting your name at number 6 again. And=20
start posting again. The thing to remember is: do you realize that=20
thousands of people all over the world are joining the internet and=20
reading these articles everyday? JUST LIKE YOU are now!! So, can you=20
afford $6.00 and see if it really works?? I think so...=20
People have said, "what if the plan is played out and no one sends you=20
the CASH? So what! What are the chances of that happening when there=20
are tons of new honest users and new honest people who are joining the=20
internet and newsgroups everyday and are willing to give it a try?=20
Estimates are at 20,000 to 50,000 new users, every day, with thousands=20
of those joining the actual internet.=20
Remember, play FAIRLY and HONESTLY and this will really work.=20
** By the way, if you try to deceive people by posting the messages=20
with your name in the list and not sending the CASH to the rest of the=20
people already on the list, you will NOT get as much. Someone I talked=20
to knew someone who did that and he only made about $150.00, and that's=20
after seven or eight weeks! Then he sent the 6 $1.00 bills, people=20
added him to their lists, and in 4-5 weeks he had over $10k.=20
This is the fairest and most honest way I have ever seen to share the=20
```

wealth of the world without costing anything but our time!!! You also=20
may want to buy mailing and e-mail lists for future CASH. Make sure=20
you print this article out RIGHT NOW! Also, try to keep a list of every=20
one that sends you CASH and always keep an eye on the newsgroups to=20
make sure everyone is playing fairly. Remember, HONESTY IS THE BEST=20
POLICY. You don't need to cheat the basic idea to make the CASH!! GOOD=20
LUCK to all and please play fairly and reap the huge rewards from this,=20
which is tons of extra CASH.=20
Please remember to declare your extra income. Thanks once again...=20
"People have asked me if this is really legal. Well, it is! You are=20
using the Internet to advertise your business. What is that business?=20
You are creating a mailing list of people who are interested in home=20
based computer and online business and methods of generating income at=20
home. Remember, people send you a small fee to be added to your mailing=20
list. It is legal. what will you do with your list of thousands of=20
names?=20
That's up to you." So, build your mailing list, keep good accounts,=20
declare the income and pay your taxes. By doing this you prove your=20
business intentions. Keep an eye on the newsgroups and when the cash=20
has stopped coming (that means your name is no longer on the list),=20
you just take the latest posting at the newsgroups, send another $6.00=20
to the names stated on the list, make your corrections (put your name=20
at #6) and start posting again.=20
NOTES:=20
*1. In some countries, the export of the country's exchange is illegal.=20
But you can get the license to do this from the post office, explaining=20

```
the above statements (that you have an online business, etc. You may=20

have to pay an extra tax, but that's OK, the amount of the incoming=20

CASH is HUGE! And as I said, a few countries have that restriction.=20

*2. You may want to buy mailing and e-mail lists for future CASH. (Or=20

Database or Spreadsheet software.)=20

*3. If you're really not sure or still think this can't be for real,=20

please print a copy of this article and give it to someone who really=20

needs the CASH, and see what happens.=20

*4. You will start getting responses within 1-2 weeks, it depends.=20

***ALSO REMEMBER***=20

SEND YOUR $1 OUT TO EVERYONE ON THE LIST,=20

EVEN IF THEY ARE NOT FROM THE U.S.=20

WHAT ARE YOU WAITING FOR???=20

$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!=20

GOOD LUCK!!!=20

<P>&nbsp;</P>
<P>Subject: $6 Deal </P>
<P>Date: 10-01-2000 </P>
<P>Poster: Railsplitter</P>
```

```
<P>Message </P>
<P>&nbsp;</P>
<P>&nbsp;</P>
<P>A while back, I was browsing these newsgroups, just like you are now, =
</P>
<P>and came across an article similar to this that said you could make =
</P>
<P>thousands of CASH within weeks with only an initial investment of =
</P>
<P>$6.00 plus stamps! So I thought, "Yeah, right, this must be a scam!" =
</P>
<P>But like most of us I was curious and kept reading. It said that if =
</P>
<P>you send $1.00 to each of the 6 names and addresses listed in the =
</P>
<P>article, you could make thousands in a very short period of time. You =
</P>
<P>then place your own name and address at the bottom of the list at #6, =
</P>
<P>and post the article to at least 300 newsgroups. (There are about =
</P>
<P>32,000 of them out there and that's quite a large market pool). No =
</P>
<P>catch, that was it. Even though the investment was a measly $6, I had =
</P>
<P>three questions that needed to be answered before I could get =
involved </P>
<P>in this sort of thing. </P>
<P>1. IS THIS REALLY LEGAL? </P>
<P>I called a lawyer first. The lawyer was a little sceptical that I =
would </P>
<P>actually make any CASH but he said it WAS LEGAL if I wanted to try =
it. </P>
<P>I told him it sounded a lot like a chain letter but the details of =
the </P>
<P>system (SEE BELOW) actually made it a legitimate legal business. </P>
<P>2. IS OK WITH THE POST OFFICE OR IS IT MAIL FRAUD? I called them: =
</P>
<P>1-800-725-2161 and they confirmed THIS IS ABSOLUTELY LEGAL! (See 18, =
</P>
<P>h sections1302 NS 1341 of Postal Lottery Laws). This clarifies the =
</P>
<P>program of collecting names and addresses for a mailing list. </P>
<P>3. IS IT RIGHT? Well, everyone who sends me a buck has a good chance =
of </P>
<P>getting A LOT of CASH ... a much better chance than buying a lottery =
</P>
<P>ticket!!! </P>
<P>So, having these questions answered, I invested EXACTLY $7.92 ... six =
</P>
<P>$1.00 bills and six 32 cent postage stamps ... and boy am I glad I =
did! </P>
<P>Within 7 days, I started getting CASH in the mail! I was shocked! I =
</P>
<P>figured it would end soon and didn't give it another thought. But the =
</P>
<P>CASH continued coming in. In my first week I made between $20 to $30. =
</P>
<P>By the end of the second week I had a made a total of $1,000.00. In =
the </P>
<P>third week I had over $10,000.00 and it was still growing. This is =
now </P>
<P>my fourth week and I have made a total of just over $42,000 and it's =
</P>
<P>still coming in ..... It's certainly worth $6.00 and 6 stamps !!! =
</P>
<P>Also, make sure you print a copy of this article NOW, so you can get =
</P>
<P>the information off of it as you need it. I promise you that if you =
</P>
<P>follow the directions exactly, that you will start making more CASH =
</P>
<P>than you thought possible by doing something so easy! </P>
<P>Suggestion: Read this entire message carefully! (print it out or </P>
<P>download it.) Follow the simple directions and watch the CASH come =
in! </P>
<P>It's easy. It's legal. And your investment is only $6.00 (plus =
postage) </P>
<P>IMPORTANT: This is NOT a rip-off; it is NOT indecent; it is NOT </P>
<P>illegal; and it is virtually no risk - it really works!!!! If all of =
</P>
<P>the following instructions are adhered to, you will receive </P>
<P>extraordinary dividends. </P>
<P>PLEASE NOTE: </P>
<P>Please follow these directions EXACTLY, and $50,000 or more can be =
</P>
<P>yours in 20 to 60 days. This program remains successful because of =
the </P>
<P>honesty and integrity of the participants. Please continue its =
success </P>
<P>by carefully adhering to the instructions. You will now become part =
of </P>
<P>the Mail Order business. In this business your product is not solid =
and </P>
<P>tangible, it's a service. You are in the business of developing =
Mailing </P>
<P>Lists. Many large corporations are happy to pay big bucks for quality =
</P>
<P>lists. However, the CASH made from the mailing lists is secondary to =
</P>
<P>the income which is made from people like you and me asking to be =
</P>
<P>included in that list. </P>
<P>Here are the 4 easy steps to success: </P>
<P>STEP 1: Get 6 separate pieces of paper and write the following on =
each </P>
```

```
<P>piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US =
$1.00 </P>
<P>bills and place ONE inside EACH of the 6 pieces of paper so the bill =
</P>
<P>will not be seen through the envelope (to prevent thievery). Place =
one </P>
<P>paper in each of the 6 envelopes and seal them. You should now have 6 =
</P>
<P>sealed envelopes, each with a piece of paper stating the above =
phrase, </P>
<P>your name and address, and a $1.00 bill. What you are doing is =
creating </P>
<P>a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate =
</P>
<P>service and you are paying for it! Like most of us I was a little =
</P>
<P>skeptical and a little worried about the legal aspects of it all. So =
I</P>
<P>checked it out with the U.S. Post Office (1-800-725-2161) and =
they</P>
<P>confirmed that it is indeed legal! Mail the 6 envelopes to the</P>
<P>following addresses:</P>
<P>&nbsp;</P>
<P>#1) M. Weber </P>
<P>801 Oaklands Dr </P>
<P>Round Rock, TX 78681 </P>
<P>#2) S. Patti </P>
<P>1808 Ponderosa St.</P>
<P>Cocoa, Fl.,32926</P>
<P>#3) Gill </P>
<P>58 Moross</P>
<P>Mt. Clemens Mi. 48043 </P>
<P>#4) Ryan Dick</P>
<P>7603 Canyon Dr.</P>
<P>Meridian, ID 83642</P>
<P>#5) Y.S.</P>
<P>2702 A Jenner Dr.</P>
<P>Baltimore, MD 21209</P>
<P>#6) D. Sims</P>
<P>905 Burning Bush Drive</P>
<P>Loganville, GA 30052</P>
<P>step 2: Now take the #1 name off the list that you see above, move =
the other=20
</P>
<P>names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as =
number 6 on=20
</P>
<P>the list.</P>
<P>&nbsp;</P>
<P>STEP 3: Change anything you need to, but try to keep this article as =
</P>
<P>close to original as possible. Now, post your amended article to at =
</P>
```

```
<P>least 300 newsgroups. (I think there are close to 32,000 groups) All =
</P>
<P>you need is 300, but remember, the more you post, the more CASH you =
</P>
<P>make! This is perfectly legal! If you have any doubts, refer to 18 =
</P>
<P>Sec. 1302 &amp; 1341 of the Postal lottery laws. Keep a copy of these =
</P>
<P>steps for yourself and, whenever you need CASH, you can use it again, =
</P>
<P>and again. </P>
<P>&nbsp;</P>
<P>PLEASE REMEMBER that this program remains successful because of the =
</P>
<P>honesty and integrity of the participants and by their carefully </P>
<P>adhering to the directions. Look at it this way. If you are a person =
</P>
<P>of integrity, the program will continue and the CASH that so many =
</P>
<P>others have received will come your way. </P>
<P>NOTE: You may want to retain every name and address sent to you, </P>
<P>either on a computer or hard copy and keep the notes people send you. =
</P>
<P>This VERIFIES that you are truly providing a service. (Also, it might =
</P>
<P>be a good idea to wrap the $1 bill in dark paper to reduce the risk =
of </P>
<P>mail theft.) So, as each post is downloaded and the directions </P>
<P>carefully followed, six members will be reimbursed for their </P>
<P>participation as a List Developer with one dollar each. Your name =
will </P>
<P>move up the list geometrically so that when your name reaches the #1 =
</P>
<P>position you will be receiving thousands of CASH in CASH!!! What an =
</P>
<P>opportunity for only $6.00 ($1.00 for each of the first six people =
</P>
<P>listed above) Send it now, add your own name to the list and you're =
in </P>
<P>business! </P>
<P>---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS </P>
<P>Step 1) You do not need to re-type this entire letter to do your own =
</P>
<P>posting. Simply put your cursor at the beginning of this letter and =
</P>
<P>drag your cursor to the bottom of this letter, and select 'copy' from =
</P>
<P>the edit menu. This will copy the entire letter into the computer's =
</P>
<P>memory. </P>
<P>Step 2) Open a blank 'notepad' file and place your cursor at the top =
</P>
<P>of the blank page. From the 'edit' menu select 'paste'. This will =
paste </P>
<P>a copy of the letter into notepad so that you can add your name to =
the </P>
<P>list. </P>
<P>&nbsp;</P>
<P>Step 3) Save your new notepad file as a .txt file. If you want to do =
</P>
<P>your postings in different settings, you'll always have this file to =
</P>
<P>go back to. </P>
<P>Step 4) Use Netscape or Internet explorer and try searching for </P>
<P>various newsgroups (on-line forums, message boards, chat sites, </P>
<P>discussions.) </P>
<P>Step 5) Visit these message boards and post this article as a new =
</P>
<P>message by highlighting the text of this letter and selecting paste =
</P>
<P>from the edit menu. Fill in the Subject, this will be the header </P>
<P>that everyone sees as they scroll through the list of postings in a =
</P>
<P>particular group, click the post message button. </P>
<P>You're done with your first one! Congratulations...THAT'S IT! All you =
</P>
<P>have to do is jump to different newsgroups and post away, after you =
</P>
<P>get the hang of it, it will take about 30 seconds for each newsgroup! =
</P>
<P>**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE </P>
<P>MORE CASH YOU WILL MAKE!! BUT YOU HAVE TO POST A </P>
<P>minimum of 300**</P>
<P>That's it! You will begin receiving CASH from around the world within =
</P>
<P>days! You may eventually want to rent a P.O.Box due to the large </P>
<P>amount of mail you will receive. If you wish to stay anonymous, you =
</P>
<P>can invent a name to use, as long as the postman will deliver it. =
</P>
<P>**JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.** </P>
<P>Now the WHY part: </P>
<P>Out of 300 postings, say I receive only 7 replies (a very low =
example). </P>
<P>So then I made $7.00 with my name at #6 on the letter. Now, each of =
the </P>
<P>7 persons who just sent me $1.00 make the MINIMUM 300 postings, each =
</P>
<P>with my name at #5 and only 7 persons respond to each of the 7 =
original </P>
<P>7, that is another $49.00 for me, now those 49 each make 300 MINIMUM =
</P>
<P>posts with my name at #4 and only 7 replies each, I will bring in an =
</P>
<P>additional $343.00! Now, those 343 persons turn around and post the =
</P>
```

```
<P>MINIMUM 300 with my name at #3 and only receive 7 replies each, I =
will </P>
<P>make an additional $2401.00! OK, now here is the fun part, each of =
</P>
<P>those 2401 persons post a MINIMUM 300 letters with my name at #2 and =
</P>
<P>they each only receive 7 replies, that just made me $16,807.00!!! =
</P>
<P>Those 16807 persons will all deliver this message to 300 newsgroups =
</P>
<P>with my name at #1 and if still 7 persons per 300 Newsgroups react I =
</P>
<P>will receive $117,649.00! With an original investment of only $6.00! =
</P>
<P>And some stamps. AMAZING! When your name is no longer on the list, =
you </P>
<P>just take the latest posting in the newsgroups, and send out another =
</P>
<P>$6.00 to names on the list, putting your name at number 6 again. And =
</P>
<P>start posting again. The thing to remember is: do you realize that =
</P>
<P>thousands of people all over the world are joining the internet and =
</P>
<P>reading these articles everyday? JUST LIKE YOU are now!! So, can you =
</P>
<P>afford $6.00 and see if it really works?? I think so... </P>
<P>People have said, "what if the plan is played out and no one sends =
you </P>
<P>the CASH? So what! What are the chances of that happening when there =
</P>
<P>are tons of new honest users and new honest people who are joining =
the </P>
<P>internet and newsgroups everyday and are willing to give it a try? =
</P>
<P>Estimates are at 20,000 to 50,000 new users, every day, with =
thousands </P>
<P>of those joining the actual internet. </P>
<P>Remember, play FAIRLY and HONESTLY and this will really work. </P>
<P>** By the way, if you try to deceive people by posting the messages =
</P>
<P>with your name in the list and not sending the CASH to the rest of =
the </P>
<P>people already on the list, you will NOT get as much. Someone I =
talked </P>
<P>to knew someone who did that and he only made about $150.00, and =
that's </P>
<P>after seven or eight weeks! Then he sent the 6 $1.00 bills, people =
</P>
<P>added him to their lists, and in 4-5 weeks he had over $10k. </P>
<P>This is the fairest and most honest way I have ever seen to share the =
</P>
<P>wealth of the world without costing anything but our time!!! You also =
</P>
<P>may want to buy mailing and e-mail lists for future CASH. Make sure =
</P>
<P>you print this article out RIGHT NOW! Also, try to keep a list of =
every </P>
<P>one that sends you CASH and always keep an eye on the newsgroups to =
</P>
<P>make sure everyone is playing fairly. Remember, HONESTY IS THE BEST =
</P>
<P>POLICY. You don't need to cheat the basic idea to make the CASH!! =
GOOD </P>
<P>LUCK to all and please play fairly and reap the huge rewards from =
this, </P>
<P>which is tons of extra CASH. </P>
<P>Please remember to declare your extra income. Thanks once again... =
</P>
<P>"People have asked me if this is really legal. Well, it is! You are =
</P>
<P>using the Internet to advertise your business. What is that business? =

It's rather interesting that the decline of the UK packet network is being associated with 'being allowed to do internet linking'.

Internet linking is nothing new in the UK - remember the GB7PLY scandal a few years ago ? and there are perhaps little more than two BBSs currently importing bulletins into the UK using non-radio means.

In the south of England, there is one VHF importing BBS, and another using HF. The appearance of overseas bulletins via both is sporadic.

The UK licence is very restrictive when it comes to packet operation. You may not run a BBS without a special permit called an NOV, or any 24 hour operation without the permission of the local Radiocommunications Agency office. Many bandplan allocated node linking frequencies also require you to obtain an NOV permit.

A few months ago, the Radiocommunications Agency wanted to tighten the conditions attached to these permits so that it would be impossible to carry out any experimentation with NOV'd packet links, and BBSs would be forced to carry out an inspection of any messages 'entering the UK network' rather than leaving it as a voluntary task dependent on local need. There was a major backlash from sysops, and there has been no more heard at the time of writing.

Whenever an importing BBS (radio or wired) releases an 'illegal message', onto the network, which 99% of the time is a) the result of an overseas amateur seeking to sell equipment from his shack and b) not written in English, UK BBS sysops will accuse the importer of 'putting their licences at risk'. No distinction is made between radio and wired importers, and the radio importers have the more difficult job and are the first to give up.

You would have thought that the 'advent of internet linking' would mean more BBS messages on the UK packet network. Not a bit of it.

A year ago, I was seeing over 250 bulletins a day on the UK BBS network, at the middle of this year, some 200 per day, now I am lucky to see 150 per day.

Sure - this does correspond with the RA endorsed internet linking initiative, but not the introduction of the wired importing of bulletins into the UK.

It has to be borne in mind that the first major drop coincided with the growth of the Free ISP - an ISP that was essentially free, but where a user still paid telephone charges and the ISP took a cut. The more recent reduction has happened at the same time as fixed price telephone access charges for unlimited all-day or off-peak internet access have been introduced.

Given the high degree of regulation of UK packet network resource providers, the lack of support given to (radio) importing BBSs, and the reaction to any messages sent by users which were not plain text by a small but very vocal number of BBS sysops, I have not been surprised to see the migration of packet users to a network which is better placed to provide what they want, and does not subject users and their messages with as much contempt as has been evident (once again by a minority) on the UK packet network.

When Roger complains of Junk floating round the network, I know he means Junk. Solitary corrupt remnants of multi-part 7plus floating around.

In days gone by, BBS sysops would complain of the arrival of a large series of 7plus files, and messages written using HTML. No more - those kinds of messages have long departed from our network.

73, Gareth.

For years I've been using a home-built Baycom interface under
Windows 95 using WinTNC. A new hard drive has forced me to
"upgrade" to Windows 98SE, and WinTNC doesn't work anymore.

I checked their website, and there doesn't appear to be a
fix.

Anybody have a solution, besides rebooting the machine to DOS
and using the original DOS stuff?

Thanks,

Greg.

Hi,
It seems that all the local packet activity here on L.I. NY must have moved.
I've been away from packet for a couple years, and just don't seem to find
much local action.
The hottest freq's here were always 145.010, 030, 050, 070 Now I don't hear
much at all.
Has everyone changed frequencies?, or has it just died???
If anyone from NLI happens to read this, would appreciate a listing of
currently active dx nodes and BBS's
E-mail would be greatly appreciated, so I don't miss any replies.

Tnx, es 73,
Bob, n2aud@optonline.net

>to obtain an NOV permit.

This is the (formal) case in most countries of the world. What varies is the actual enforcement of these rules, and the interpretation of details.

E.g. in the Netherlands it is formally not allowed to run an unattended station without special permit. But as long as you run it at your own QTH there will be no problem at all, because the authorities don't bother to enter in the difficult procedure of proving that you have run it while it wasn't attended. It is too much effort to get a house search permit for a minor offense like that.

And even when it isn't at your own QTH, there will be no problem as long as you are not on the list of people the frequency coordinators don't like. (the authorities will do absolutely nothing about it unless they get a request from someone in the radio society, a complaint from another individual will result in absolutely no action "because of other priorities").

This means that while there is a formal mechanism of special permits in place, a large group of stations is operating without any permit at all (besides the normal amateur radio license the operator hopefully has).

I think the situation is the same in Belgium.
So, don't think you are so badly restricted in the UK, you may just be

reading the regulations too much "to the letter".

>from operator errors, not software bugs.

While I have not run an FBB system except for some tests, I am surprised
that operator errors can corrupt a bulletin. You muse mean operators who
want to edit something out of the bulletin and damage the body?
Operator errors in setting up a forwarding link should not matter, as
the BBS (at least when it talks to other BBSes running the same improved
forwarding protocol!) will put an overall checksum over the messages,
and will reject messages that got damaged on the link.

>>Corrupted messages are caused by:

>>- use of oldfashioned forwarding protocols (RLI/4RE) which don't perform
>> end-to-end checksumming of transferred messages
>>- use of unreliable equipment that damages messages while stored in the
>> BBS.

>And the use of modem links...

I thought you were referring to Internet forwarding. While a modem may be involved, these are not modem links in the sense that there may be an unchecked RS232 line involved. Internet forwarding using TCP/IP has end-to-end checksumming on the packet level.

>Perhaps you do it correctly... Do you read any of the FBB mailing lists?

>Recently on the UK network there was an "AX25 versus TCP/IP" discussion.
>The lack of knowledge shown by some of the mailbox operators was quite
>amazing, but some of them operate internet links. Etc...

I think tens of millions of people use the Internet without any knowledge at all about TCP/IP and how it functions. Yet they don't experience data corruption when they read their mail or look at webpages. So this should be an insignificant factor.

Apparently there is some buggy piece of software floating around. Happens all the time. But that should be fixed, not seen as an unavoidable problem with forwarding over the Internet. If anything, forwarding over the Internet should be much more reliable and have much fewer data corruption and missing parts problems than forwarding over amateur radio links.

>>Any information system will always have things you are interested in and
>>things you consider useless. You are not going to fix this by complaining

>mailbox to mailbox really does make people think "What has this got to
>do with amateur radio?".

Well, one thing it has to do with amateur radio is that radio amateurs apparently did not get their packet radio network functioning correctly, and that volunteers are needed to fix that.

Unfortunately the amateur radio world is a prime example of a world where bad communication protocols are designed and then used for decades "because they are there", instead of being fixed when it appears they suck.

I have done a lot of work to fix some things, and we got a flawless BBS forwarding system at that time. I lost interest, and am not active anymore in that area. Apparently the world has moved on, and the naively or stupidly designed stuff is again spreading. You should try to do something about *that*, not complain that people forward bad or incomplete 7+ series.

>
>Internet linking is nothing new in the UK - remember the GB7PLY scandal a few years ago ? and there are perhaps little more than two BBSs currently importing bulletins into the UK using non-radio means.

I think there are more than two. But perhaps there are only two doing it properly? (Although I'm not sure if there is a proper way of using wire links on an amateur *radio* network!) Internet links are even being used over short distances within the UK to replace broken RF links, thereby removing all incentive to ever properly fix the RF links. (I'm including in "internet linking" not only "live" IP links, but also things like importing zips of bundled bulletins.)

>You would have thought that the 'advent of internet linking' would mean more BBS messages on the UK packet network. Not a bit of it.

Yes, but one of the justifications for allowing internet linking was to "breathe new life" into the UK packet network. Of course it hasn't done that, just as the use of internet links had no positive effect in the USA. What I cannot understand is why anyone should think that using wire links to transfer messages should "breathe new life" into an amateur *radio* network.

>It has to be borne in mind that the first major drop coincided with the
>growth of the Free ISP - an ISP that was essentially free, but where a
>user still paid telephone charges and the ISP took a cut. The more
>recent reduction has happened at the same time as fixed price telephone
>access charges for unlimited all-day or off-peak internet access have been
>introduced.

There is bound to be some decline in the use of the packet network as the internet becomes cheaper, because packet loses most of its attraction for those whose only interest in it is as a messaging facility. However, for those who are interested in it because it is amateur *radio*, its use remains just as valid as it was before cheap internet.

Why do UK amateurs still get a thrill out of exchanging a few sentences on 10m with a VK? Not because of the fact that they are talking to someone in Australia, they can do that any day on the telephone, it's because they're doing it on amateur *radio*.

The telephone has been available for many years as an alternative to amateur *radio* voice contacts, but it has never been perceived as a valid replacement! Could you imagine any amateur saying "I got my WAC today! First I phoned VK???. Then I phone W????, that one was difficult because the international exchange was very busy. Then I phoned..." So why is the telephone regarded as a valid replacement for amateur *radio* data links?

The main point I have been trying to make in this thread is that by replacing amateur *radio* with wire links, the packet mailbox network becomes a complete irrelevance. Also, at least in the case of the UK, the network has become subjected to a significant number of large, junk bulletins that are a major put-off to many of the remaining users and mailbox operators. Without the use of wire links, there is no way that those bulletins would ever have arrived on the network.

This puzzles me.

Are you simply saying that since the BBS sysops only speak English and
thus can not verify if the contents of a message written in a foreign
language is legal and thus, complain about it ?

Or are there really regulations stating that UK BBS messages must be
written in English ? I have a vague recollection that the UK joined
the EU, but apparently I have missed something :-). Or how about
messages written in Welsh ?

I still don't understand how your internet linking results in damaged messages.... using zip files makes this even more unlikely!

>Yes, but one of the justifications for allowing internet linking was to

A packet radio network, contrary to a couple of people talking to eachother on 20M, needs a critical mass of working links to survive. When one link fails, this may result in a noticable performance loss and people get motivated to do something about it. But when so many links have failed that fixing one or two of them will not bring anything, there will be a downward spiral because people consider "I cannot fix the network myself because too many other links that I would depend on have failed".
After a while, most of the network has failed and nobody will be in any hurry to do something about it.
I can understand why some people may have thought that fixing a couple of links, even when using non-radio means, could lift the whole thing above the critical mass again. Apparently it hasn't worked out.

>There is bound to be some decline in the use of the packet network as

Apparently for many of the users the aspect of messaging was much more interesting and important than it being amateur radio. That is not surprising, because the messaging facility was new to most people when they started to use packet, and they already knew what amateur radio is.
Now, when you show a new (potential) radio amateur the facilities of the packet network, they will just yawn and wonder how anybody could be interested in something that slow, no matter if it is amateur radio.
It does not go very much beyond "a very good demonstration tool to learn about the techniques used in networking", and you claim that is precisely what the radio amateurs don't want to do...

>Why do UK amateurs still get a thrill out of exchanging a few sentences
>on 10m with a VK? Not because of the fact that they are talking to
>someone in Australia, they can do that any day on the telephone, it's
>because they're doing it on amateur *radio*.

But there probably has been a decline in the number of those amateurs

as well. The difference is in the structure of a digital network that breaks down and makes the entire network useless when too many stations drop out. That effect is likely to be much less on a random-contact point-to-point system like HF DX.
(of course it will die when the number of stations is so low that you cannot make any interesting contacts. but packet will die much easier)

Hi, currently we are getting newly licenced amateurs in our club and some of the older ones too showing an interest in packet radio..

Can someone point me in the right direction (URL etc), for the following..

A current day reeplacement for the baycom style project.. Cheaper the better?

Packet radio using a sound card? Also whats the slowest CPU this will work on?

Is there a project using a pic chip that will emulate a complete TNC. If so does it support Kiss?

Is there a pic project or similar that can go between a GPS NMEA port and a standard TNC like a Heath Kit HK-micro 21, to do APRS? I know newer TNC's support this, but we have a lot of older TNCs in the club. Some do not support the normal eprom upgrades.

Is the Pic - E project from Tampr a full TNC style device for normal 1k2 AFSK packet? Or is it just for APRS?

Also possibly a cheap pic based TNC for 9k6 G3RUH?

Please reply via my E-mail as I probably won't check this news group again in the near future..

Hi, does anyone have the latest ROM image for the HeathKit HK-21 TNC that supports GPS connection?

If so I would love a copy e-mailed to me so I can upgrade my units I have here. I'd also be interested to hear how well they have performed with this upgrade?

TNX,
Ken. VK4AKP.

Hi, has anyone tried setting up UIview using the software drivers to make the sound blaster cards work as a packet radio modem?

Is this possible? I'd be interested to find out..

How many people do you know that have a computer and a scanner (radio)???

Just think how many people could be receiving APRS!

Can you not buy these ROMs from heathkit? Your not planning on Pirating
them are you? Looks like it to me.

Based on your other messages, you don't like paying for much.

Don't be so cheap.

Perhaps because the place to start is to help yourself. The issue you raise is not a new one, and has been discussed - many times - in this news group. As the most cursory search would show.

This is a *discussion* group: the information flows both ways. If you want information back, perhaps you should contribute something.

It is an insult to ask questions in a newsgroup and asking for replies by
mail.  Why?  Because a newsgroup is not a computer, but a group of people
that reply to your question after reading it.
You are telling them that you are interested in replies but do not want
to spend any effort to read them.  Why would the group bother to make the
effort to write you a response?

Besides, a similar question was asked last week.

Rob

The following quote from a usenet FAQ might be of help to you:-

"If you do not read a newsgroup, you cannot know what the subject of the newsgroup is, what the standards of behavior are, what the frequently discussed topics are. Usenet does not exist to give you a free research tool. It is also considered incredibly rude to post a question to a newsgroup you do not read, and ask for replies in e-mail - by doing so, you are telling the people you want to answer your question that their issues are not important to you."

(The full document can be found at -

I think the real issue here is since when has it become acceptable to insult
people for asking a question?. I know I know my parents raised me to have
manners and to try and be helpful instead of condescending.

It's because you put a criticism trigger in your article.

Normally when you ask a FAQ and nobody is interested in replying, things will just remain quiet. But ask for replies via e-mail and you will get flamed.

Don't think this is somehow unique to this group, it is a property of Usenet.

Rob

Sorry, no pond (or swimming pool) here. Tresspassers are normally shot, drawn,
and quartered BEFORE being interrogated.

Don't let the negative post bother your.

Have you checked out www.packetradio.com? It is full of usefull information.
Also, the last issue of QST has plans for a kiss mode tnc. Check it out.

Hi.

> Can you not buy these ROMs from heathkit?

I was lead to believe quiet some years back that Heath Kit do not exist anymore.

>Your not planning on Pirating
> them are you? Looks like it to me.

The only source for the Eproms that I have been told about is pacomm. Now if they've taken the original code, modified it to include GPS and then re sell it over and over again.. WHo's pirating?? Humm???

> Based on your other messages, you don't like paying for much.

You should try reading the messages a little better. I admit, in the case of the HK-21 aprox A$150 to get an eprom to upgrade the TNC is not very appealing!

I could buy a whole new TNC for that sort of money.

But, with regards to the other questions, I am doing research to help our local club get users on the air with packet cheaply. Now it's not I that is after cheap solutions for this. I have a number of TNC's here. PK232MBX, PK88's, HK21's. It is the general attitude of most amateurs wishing to enjoy their hobby as cheaply as possible.

Personally I can't see why anyone in their right mind would want to disagree with this?.. After all it is a hobby!

> Don't be so cheap.

I offer my time for free and my help for free to try and promote the hobbie locally and otherwise in worrying times like this where we are currently loosing bands through lack of use. ANd I get rubbish like this as a reply to questions that are designed to help increase Amateur radio activity.

How pitifull! :(

Try a more posative attitude in future.

Regards,
Ken.

> Perhaps because the place to start is to help yourself. The issue

Is this supposed to make sence?
Help myself? Actually I'm doing this to try and help others..

OK I'll bite. What are you trying to say or suggest by suggesting I need to try and help myself?

> you raise is not a new one, and has been discussed - many times -

With something as large as the internet, and the amount of data that flows through it every day, surely you don't expect that I read the complete contents of every news group regularly.. ???

> in this news group. As the most cursory search would show.

Well I looked through the group before I posted, and saw nothing relatinng to what I was asking.. Even so. What's the big deal. It wouldn't be the first time a question has been asked more than once in a forum.

> This is a *discussion* group: the information flows both ways.

> If you want information back, perhaps you should contribute
> something.

Well, I have replied to a number of msgs in other forums regarding CDR technology recently. And I would be happy to do similar if I read something I can help with here..

What suprises me is that I put out some questions and all of a sudden I get criticised..

Seems like a wasted resource if this is all it's good for?

I think in future I won't even take the time to respond to negative replies.

Regards,
Ken.

Like you said in another thread, the Internet is a big place, did you even
look? I doubt it, you post messages here, then expect everyone to reply to
your personal EMail and GIVE you what you want.

> I could buy a whole new TNC for that sort of money.

Buy a TNC Then, obviously by your posts, ANYTHING more than Free is "Too
Much Money" There IS such a thing as being too cheap.

> Try a more posative attitude in future.

Considering the source, this line does not apply. BTW: Spells checkers work
wonders in newsgroup posts. :)

It is difficult to say what the 'right' thing to do is, but it is near-certain
that the only way to prevent old programs (such as Pc PakRatt) from dying out
is to Open-Source them.

Anything else will kill it. The profit is not there for commercial versions
anymore.

A good example of the attitude too many hams have that turns people off. Seen it all my life as a amateur. The old "Go away kid, don't bother me I don't have time for you" routine.

BTW, Laura., you don't have to read the posts if you don't want to. Just skip to the next thread.

It is perfectly acceptable for someone to ask for a reply off-line. Some consider it polite. It's also alot easier to read email than it is news, especially if they are on the road. Try scanning thru 200+ Usenet posts with a wireless web cell phone. Email is much more efficient re. bandwidth.

Yes, a topic may have already been discussed but there are folks who may have a fresh insight or new information that might not have been covered previously. I would be interested in the latest info on Cheap TNC's myself.

Lurk mode on...

73 and CUL,
-barryc / N5NWI

Ok...probably something I'm overlooking, but I have fiddled with it
for over an hour now...

How do I zoom into a section of the map? I have the colored relief map
for the US, and want to look at just greater Ohio. Ive made an .INF
file with the coordinaces, and placed it in the MAPS directory, but it
still wont show up.

Any ideas?

Thanks much.

Cannot be done. You have to cut a part of the map with a photo processing
program, save it under a different name, and then setup .inf coordinates
for that partial map. You zoom to the section by selecting that different
map.

Rob

You need to make yourself some more detailed maps for the relevant area. For the USA you can easily make them from Street Atlas or Precision Mapping. There's a map grabbing utility for Street Atlas on my web site. It was designed to be used with the 32 bit version of UI-View, but it also works ok with the 16 bit version.

For general guidance on making UI-View maps, read the "UI-View Maps" section of the help.

Assuming you are still reading the newsgroup, I'm putting the information here for *ALL* readers - not just the ones who can't be bothered to come and read it.

You will find what you are looking for at our club website (URL in sig).

This has all the details of a 9k6 modem what will run on an SCC card, on the disconnect header of a TNC or stand-alone on the serial port of a PC. Drivers are available for DOS (BPQ, *NOS, Ethernet) Win95/8 (sv2agw) and Linux.. All circuits, PCB layouts, CPU code, construction details, testing methods - the lot.

In future, remember that this resource is Usenet first, radio (amateur, unlicensed or otherwise) enthusiasts second, so keep to the accepted practice of Usenet please.

I have experimented with Flexnet software with the soundcard driver on DOS and it seems that the software somehow misses some of the packets, maybe 30%. The S-meter indicates that there is a strong packet transmission but the software doesn't display anything when monitoring. SOmeone suggested keeping the squelch open all the time but it didn't seem to help. While adjusting the audio signal level with SMDIAG utility I noticed it misses packets too. I wonder if this is specific to the soundcard software and if an external TNC would perform better ? Any experiences with the same software anyone ?

There is no zooming in UI-View. That's a line vector technique.
UI-View uses pictures, and zooming into a picture just results
in distortion.

I admit this is a little hard to get used to, but after a couple of
days the zoomed-in vector line maps seem quaint by comparison.

The first thing I would try is run a scope program, and let a station transmit continuous flags.
Then judge the quality of the audio. There are some things that can go wrong in the chain from receiver to digitized sound, and this method allows you to see if it is OK.

(at least when you know what to look for...)

Well, the cheapest way to get this is to break into a ham radio store, and steal their stock. Or maybe steal from one of your other local hams.

Stealing software is not quite as bad, since you're not depriving the owner of the use of that software, but you are depriving them of some value.

Has PSK31 been used much on 2m SSB and does it work ok? One ham commented that there wasn't a lot of activiity because it is not matched to propagation on 2m. Is this true?

If there is some activity on 2m, what frequencies are used in Europe? In the UK, the recommended frequency is 144.085MHz +/-5kHz. However, I have seen very little activity there. Are there other common frequencies?

On a final note, does anyone in the UK/Europe within 200 miles of IO90HX wish to arrange a sked?

Dear Friend:
With a couple of minutes of your time I'm
going to show you how you can
turn
$6 and
6 stamps into thousands of dollars. Don't
get skeptical yet, just read
the
letter and then decide if you want to invest
a measly $6!!

HOW TO TURN SIX DOLLARS INTO SIX THOUSAND:
READING THIS COULD CHANGE YOUR LIFE! Wow!!
IT DOES WORK!

A little while back, I was browsing through
newsgroups, just like you
are
now, and came across an article similar to
this that said you could make

thousands of dollars within weeks with only
an initial investment of
$6.00!
So I thought, "Yeah right, this must be a
scam", but like most of us, I
was
curious, so I kept reading. Anyway, it said
that you send $1.00 to each
of
the 6 names and address stated in the
article. You then place your own
name
and address in the bottom of the list at #6,
and post the article in at
least 200 newsgroups.
(There are thousands) No catch, that was it.
So after thinking it over,
and
talking to a few people first, I thought
about trying it. I figured:

"What have I got to lose except 6 stamps and $6.00, right?" Then I invested the measly $6.00. Well GUESS WHAT!?...Within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just

kept coming in. In my first week, I made about $25.00. By the end of the

second week I had made a total of over $1,000.00! In the third week I had over 10,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery!! Let me tell you how

this works and most importantly, WHY it works... Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy! Six Bucks and Six stamps... not a big deal to get lots more $$$$. IT WORKS!!!! Suggestion: Read this entire message carefully! (print it out or download it.) Follow the simple directions and watch the money come in! It's easy. It's legal. And, your investment is only $6.00 (Plus postage).

IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is 99% no risk - it really works! If all of the following instructions are adhered to, you will receive extraordinary dividends.

PLEASE NOTE:
Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions.
You will now become part of the Mail Order business. In this business your product is not solid and tangible, it's a service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is made from people like you and me asking to be included in that list.

Here are the 4 EASY, EASY, EASY steps to success:

STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST."
Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery).

Next, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a $1.00

bill. What you are doing is
creating a service. THIS IS ABSOLUTELY
LEGAL! You are requesting a
legitimate service and you are paying for
it! Like most of us I was a
little
skeptical and a little worried about the
legal aspects of it all. So I
checked it out with the U.S. Post Office
(1-800-725-2161) and they
confirmed
that it is indeed legal. Mail the 6
envelopes to the following
addresses:

1) Sue Wagner
608 First Avenue

STEP 2: Now, you do not need to re-type this
entire letter . Simply put
your
cursor at the beginning of this letter and
drag your cursor to the
bottom of
this document, and select 'copy' from the
edit menu(or right mouse click
and
choose "copy"). This will copy the entire
letter into the computer's
memory

temporarily. Now click "Start" then
"accessories" then "wordpad" Open a

blank 'notepad' file and place your cursor
at the top of the blank page.

>From the 'edit' menu select 'paste'.(or
right mouse click and choose
"paste") This will paste a copy of the
letter into notepad so that you
can
add your name to the list. Take the #1 name
off the list that you see
above,(to do so, put your cursor at the end
of the address of the FIRST
(#1)
address and click "backspace" until name and
address are gone.) Change
the
other numbers to one lower number (6
becomes 5, 5 becomes 4, etc...) by

putting your cursor on the right side of
each number and pushing
backspace
one time, then type the new number and add
YOUR Name as number 6 on the
list. (when you add your name it may be
double spaced... thats ok.)

STEP 3:. Now, post your amended article to
at least 200 newsgroups (I
think
there are close to 24,000 groups). All you
need is 200,
but remember, the more you post, the more
money you make! You won't get
very
much unless you post like crazy. :) This is
perfectly legal! If you have
any
doubts, refer to Title 18 Sec. 1302 & 1341
of the Postal lottery laws.
Keep
a copy of these steps for yourself and,
whenever you need money, you can

use it again, and again.

PLEASE REMEMBER that this program remains
successful because of the
honesty
and integrity of the participants and by

their carefully adhering to the

directions. Look at it this way. If you are
of integrity, the program
will
continue and the money that so many others
have received will come your
way.

NOTE:
Iit might be a good idea to wrap the $1 bill
in dark paper to reduce the

risk of mail theft.) As each post is
downloaded and the directions
carefully
followed, six members will be
reimbursed for their participation as a List
Developer with one dollar
each.
Your name will move up the list so that when
your name reaches the #1
position you will be receiving thousands of
dollars in CASH!!! What an
opportunity for only $6.00 ($1.00 for each
of the first six people
listed
above) Send it now. Add your own name to the
list and you're in
business!

Dear Ed,

That is a very clever idea (the pilot transmitter) and worth considering in any new design. However, I have not heard anything else encouraging concerning uhf or higher frequency microtransmitters. I very much doubt there would be any interference problems as the swamps containing these endangered turtles are many miles from any towns, and 50 miles from any significant city (Charleston, SC). And I am doubtful that there is much 2.4 ghz amateur activity in the area!

The commerically available vhf transmitters (154 mhz or thereabouts) are relatively small (0.75 x 0.35 inches approx) and will run for 4-6 months on two watch batteries - they pulse about once a second. But they cost about $300US each. Since we need to put 30+ of these on turtles, this starts to add up big time! Perhaps I will look into cloning the vhf units as an alternative to trying to develop a higher frequency system.

Thanks again for your thoughts.

cheers,

Tim kc4ycx

I am having a problem trying to use PSK31. My problem is that there is a frequency offset of about 76Hz between my transmit frequency and the receive. AFC, Net, Snap are all turned on.. The receive and transmit offsets on the transceiver (a Paragon) are not used.

It seems as if the sound card is putting out a slightly lower frequency on transmit but I have know idea what the problem may be.. RFI??

Anybody got an idea?

73

rec.radio.amateur.digital.misc:1121 uk.media.radio.misc:159
aus.radio.amateur.digital:59 alt.radio.internet.kcuf:3 alt.radio:295

On my worldspace receiver, aside the "usual" audio channels there are a
couple of data streams called "Dirmedia data", "ALC data", etc.
By plugging my macintosh serial port to the receiver serial port I can
see there are bits passing, but I don't even know the data rate -neither
do I know what it is.
In the receiver documentation there is no information ("connector for
further extension").
I couldn't find anything on internet...

Does someone know what these channels are, how to record them (with
which software...)?

Many thanks,

Herve

> My problem is that there is a frequency offset of about
> 76Hz between my transmit frequency and the receive.

More likely there is a small offset in the transceiver (calibration).
You probably wouldn't notice it on SSB. You could turn on the receive
offset and set it to get the PSK signals on the same freq. I think

DigiPan has an offset function in the works for a future version - a
number of people are experiencing the same problem you are.

Welcome to the world of Amateur Radios. It's pretty common to have RX and TX
not on the same frequency. I've got one rig that's 160 Hz off. While it's

barely noticeable on voice, it's just about useless in digital modes. There should be alignment procedures for your radio to get the two on the same frequency, otherwise, it's time to learn how to set the RIT and leave it alone.

Thanks, but a couple of things. First there is no offset between the transmitter and receiver frequencies (unless I turn it on) therefore the rig does not need alignment. . Second the TX OFF is too course (10 Hz steps). I also have RIT, but that too is in 10 Hz steps. I have been advised by some others that the problem could be with the sound board. I have tried moving computer, monitor and all further away from the rig in case it might be RFI with no change or any improvement at all.

I am next going to try another computer and see what happens.

Thanks for the input.

How did you check that?

>I have
>been advised by some others that the problem could be with the sound
>board.

That seems extremely unlikely to me. This would mean the samplerate for RX
and TX somehow is different. I can understand how the samplerate could
drift, but I presume any reasonable manufacturer would use one single
reference oscillator for all sample rates, so how could they drift
independently?

Rob

Thanks to all that responded..

Yes, the problem is with the rig. I contacted TenTec and they provided
me with information on a mod that should fix the problem... Now off to

the parts store for a couple of things and will advise the results
when I get the mod done.

Thanks again and 73

Again thanks to all who responded to my question.. The problem has been fixed.... Required installing a couple of diodes to add a balancing bias on a couple of transistors in the Paragon...

Easy said and hard to do with my old, fat, shakey fingers... But done none-the-less.

Again thanks to all.

vry 73

PSK-31 and AGW Packet Engine support planned PacTerm '98 and PKTerm '99
Release 1.5

Muscle Shoals, Alabama. November 1, 2000: Creative Services Software has
announced that PacTerm '98 and PKTerm '99 release 1.5 will support the hot
new mode PSK-31 as well as the AGW Packet Engine. This is the first product
to integrate DSP sound card technology in conjunction with TNC technology.
This release will be a FREE upgrade for owners of the current product and
users who purchase the product today.

New enhancements for version 1.5 include:
- PSK-31 sound card support, using the TNC's keying circuit or the TNC's serial port for keying the radio with RTS or DTR, saving a serial port for other functions!!!
- AGW Packet Engine for sound card Packet support
- Support for 2 simultaneous TNCs (1 packet and 1 multimode)
- Point and click to set TNC commands for startup
- Startup/Shutdown commands for each call sign
- 10 mode-specific macros in addition to 10 global macros for each call sign
- CQ, ID and QRT macros
- Pactor connected station call sign display in title bar

The popular TNC program, written in C++, has been available since November

1997. It supports Multistream Packet, each in its own window, and all HF modes, user defined macros, user defined colors and fonts, CD callbooks, COM1 through COM35 (including select USB to serial port converters), Quick Connects, save session in RTF or TXT format and much, much more.

The program runs under Windows 95/98/Me and Windows NT/2000. It is a true 32-bit Windows application, designed using the Windows Style Guidelines available from Microsoft.

PacTerm '98 and PKTerm '99 are $79.95. They are available directly from Creative Services Software or your favorite dealer. You can also download the program in demo mode from the CSS web site.
Creative Services Software is at http://www.cssincorp.com.

Windows, Windows 95, Windows 98, Windows NT and Windows 2000 are Registered Trademarks of Microsoft Corporation.

George,

Many of the hams in this area are setting the rig to 144,143.500 USB and working the 2.5 kHz. up from there. A Monday night Hoot Owl Net meets on 144,145.00 at 10:00 PM EST. The location is Bloomington, Indiana, EM69.

You are welcome to check for more information on my home page via www.qrz.com.

73,
Lee Easley, K9QDR

Okay Guys, Im a girl who wants to buy two or more radios for my family.

I have read 90% of this site today, and I think I have a feel for whats out there, however, I must ask you
a few simple questions

1. Based upon your opinion, are the new FRS/GRMS combo radios designed with as many features as the top end Motorola, Cherokee, or other radios?

2. Which FRS/GMRS has THE most features, and works the best?

3. Which of these has the best price for all the features you do get?

4. Should I consider digital transmissions?

Thanks!!!! I'll need your help to make my final decesion.

Tracey

Do yourself a favor and when shipping do not use UPS. They are the most expensive and the most incompetent delivery service available. They find it impossible to deliver even the simplest of package without damage and on time. You do not need the trouble this company will cause.

We've been showing it this weekend at the Stone Mountain (Atlanta) hamfest,
with good response.

Drop by our home page and sign up for the css newsletter reflector. The
minute it is released, we'll send an email out to everyone and you can get
this free update (for those that own 1.4 or before).
http://www.cssincorp.com

Read the other 10% of the "site" and you'll find answers such as:

1. There are no FRS/GMRS combo radios...Either FRS or GMRS which shares
some channels with FRS, but requires a license.

2. GMRS has many nice features, but require a license to operate.

3. The Ranger/Fannon Courier models

4. Digital is not alowed on FRS

Funny- My experience has been quite the contrary- My biggest problems
have been Fedex (gets lost when not in the city) and RPS (sends Semi on
country roads with 2lb package)

Another problem is people posting stuff like this on multi-NG addresses,
not on subject- and probably just to get revenge after a dissagreement.

The new Audiovox GMRS raios do not have the option of changing to a better antenna..I would saty away from that setup.

Strange. Over about 5 yrs or so, I've had at least 60 or 70 pkgs delivered and sent through UPS and only two problems. One was delivered two days late and the other was a minor damage problem . They had me fill out some forms and sent me a check for the insurance money within one week. They told me to keep the goods and they didn't even want to look at it. Couldn't ask for better service. Unfortunately, it is inconvenient for me to use UPS and I end up using USPS and with them, have never had a problem.

Herbal V: An Incredible All-Natural Healthy Alternative To V----a

Herbal V is the All Natural Approach to Male Virility,
Vitality and Pleasure.

Available Now!

Welcome to the New Sexual Revolution.

It's the all natural male potency and pleasure pill that men everywhere are buzzing about. Herbal V is safe, natural and specifically formulated to help support male sexual function and pleasure. You just take two easy-to-swallow tablets one hour before sex. And there's more great news - you can get Herbal V for less than $1 a pill.

Amazing word of mouth praise on Herbal V has been spreading like wildfire-already over 1,500,000 men have chosen Herbal V. Since it is 100% natural you will never have to worry about safety. Try doctor-recommended Herbal V today and have the greatest night of your life!

Herbal V... Bringing Back the Magic!

1,585,000 men can't be wrong. To date over 1 million men
have tried the super supplement Herbal V.
Here is why:

No Doctor Visit Required
Available Over the Counter
Not a Drug
100% Natural
Safe, No Worries
Highest Quality Pharmaceutical-Grade Pure Nutriceuticals
Guaranteed Potency & Purity

Be a Real Man Again!

Questions and Answers

What is Herbal V?

Herbal V is a proprietary blend that was specifically developed as a safe alternative for men who prefer an all-natural approach to address impotence and boost sexual performance. This amazing formula first became popular with Hollywood insiders and the wealthy elite. They were maximizing their sex lives, long before it was available to the general public.

How does Herbal V work?

Developed by a team whose goal was to create the perfect all-natural aphrodisiac. Herbal V is the result of that remarkable effort. The Herbal V formula contains a precise blend of cutting edge pro-sexual nutrients from around the world that provide nutritional support, making it possible for a man to have a pleasurable sexual experience.

What can Herbal V do for me?

Herbal V helps support male sexual function and pleasure in a safe and natural manner. Simply put, it can make your sex life incredible.

Is Herbal V Safe?

One of the great things about Herbal V is that it is not a drug. It is an incredible herbal dietary supplement that provides nutritional support for male sexual function and pleasure. One of the most comforting features of Herbal V is that you never have to worry about safety.

Herbal V: Safe - Natural - Exciting

Many have speculated that because Herbal V is so
popular with men, it must contain prescription drugs
or chemical components. Herbal V does not contain any
elements or traces of any prescription drug. Herbal V
is made using the world's most technologically advanced
state-of-the-art cold processing equipment to ensure
maximum purity. Herbal V has been independently analyzed
by the nation's premier testing facility to ensure purity,
quality and to end the rumors that, because it is so
popular, it must somehow be chemical. It is not.
Herbal V is natural - just as it says on the label.
Herbal V is simply fantastic!

Herbal V: Ingredients

Yohimbe, saw palmetto, avena sativa, androstenedione,
guarana, taurine, siberian ginseng, tribulus terrestris.
Tribulus Terrestis is certified to enhanced testosterone
levels by increasing Luteinzing hormone (LH) levels.
Androstenedione which is a precursor to testosterone
unlocks bound testosterone and makes it biologically
active again quickly. This means a dramatic surge in
desire. Avena Sativa Stimulates the neurotransmitter
pleasure centers to maximum capacity. This greatly
intensifies pleasure.

Just listen to what Herbal V has done for the sex lives
of people like you!

"On a scale of 1 to 10, it's a 15. Electrifying. It's like
a wonder pill!"
- Justin Q B., New Haven, Texas

"I haven't had sexual relations in 11 years. Then with
Herbal V it was... wow! It works again!"
- Sid R., Lakeland, Florida

"I had sex four times in one night. It made me feel
like a 19-year-old again."
- Chip S, Beech Mountain, North Carolina

"Herbal V has turned my husband into a Sexual Superman!
I like the fact that it's all natural and has no
side effects. It's bringing back the good old days."
- Jennifer B, Beverly Hills, California

The above testimonials are from product literature,
and we have not independently verified them.
However, the following testimonial is from a "senior"
gentleman who has purchased his second bottle of
Herbal V. When we heard his words with our own ears,
we asked his permission to print them here.

"Man! I'm wild as I can be! I feel like I'm 25 years old again! I'm not believing this!"
- Mr. Murphy, age 64, Lampart, IL.

Risk Free: Double Your Money Back Guarantee

If Herbal V does not give the desired results as stated above, simply return the unused portion for a double-your money back refund. No questions asked !

Order Now: Safe, Fast, Secure, Private

Herbal V with its DOUBLE YOUR MONEY BACK GUARANTEE is available only through this special promotional offer.
Herbal V arrives in plain packaging for your privacy.
Any and all information is kept strictly confidential.

Payment Methods

You may FAX or Postal Mail Checks, MasterCard, Visa, & American Express.payments. Money Orders are accepted only by Postal Mail.

Each bottle of Herbal V contains 30 tablets, approximately a 1 month supply.

Step 1: Place a check by your desired quanity.

I agree. UPS' delivery time has been ridiculous lately. I have been shipping with the Post Office Priority Mail for items less than 5 pounds because it is a lot cheaper and quicker. Although, I believe UPS is cheaper on the heavier stuff than the post office but it takes longer for UPS to deliver.

Snip big one ....

What a deal ...get screwed at less than a buck a pill. Not only that
but this stuff will let you work over 300 countries, hear DX 1 hour
earlier on your Yagi with out a quad and best of all ... keep your tower
up in a 150 MPH gale. 73 KI3R

Hmm..... I remember a someone who used this address being one of the most infamous trolls on this group..... nonetheless, I believe the MALE who was using this address was simply using the *real* Tracey Levin's adress to post from.... as such I consider this a legitimate post, and will hold no judgement for now.... in other words, I will consider the poster of this article to be friendly.

>
>1. Based upon your opinion, are the new FRS/GRMS combo radios designed
>with as many features as the top end Motorola, Cherokee, or other
>radios?

GMRS and FRS radio combos do not exist. You *can* use a GMRS radio on the 7 shared FRS freqs,..... IF you hold a valid GMRS license.

>
>
>4. Should I consider digital transmissions?
>

Digital comms are not permitted on FRS... or any other type of non-voice communications... (the exception is the 1 year experimental waiver provided to allow for GPS coordinates to be transmitted via FRS. This waiver was granted to a specicific company for development purposes)

As far as GMRS... I do not know if comms other than voice are permitted.

My elmer had very bad arthritis but wants to do CW....anyone have a
simple program for sending and receiving morse code in a windows
environment? Because of the stiffness in his fingers he needs to be
able to type a keyboard to send code and read it on a screen.
Also a simple interface....he will be using a seperate xmtr/rcvr for
this.
Please help me if you can.

Dick

Yes, it works with everything from a PK-87 to the new PK-232 DSP.

Thanks. Forgot to ask. Will the demo version interface with Log
Windows for DX Packet Cluster data? And will it work with Windows Me?

Oh, come on Phil, you didn't really expect a message relating to anything electronic in a radio newsgroup, did you? Since this is a radio newsgroup, the message had to be about United Parcal. Gee, you need to get these newsgroups figured out. Electronics related stuff is discussed in the child birth newsgroup, and I haven't found where amateur radio related topics are discussed yet. If you come across it, let me know.

  Oh.....

  I thought from the title that you were relating the fact that
  if one overcharges the batteries in an Uninterruptable Power
  Supply (commonly called a UPS) the UPS will not deliver as much
  power as compared to properly charged and conditioned batteries.

Yes, it will work with Windows Me, and Windows 2000, as well as all other
flavors of Windows.

The terminal window is not available in demo mode, but it does support both
TNC packet cluster access as well as Telnet cluster accesss.

Maybe you will start "rec.radio.amateur.digital.aprs"?

I don't know of any non-local (or local) newsgroups exclusively for APRS.
There are plenty of web sites, however. Maybe someone else has started one.

What I don't understand is why the radio manufacturers would propose
a band which would only accomodate 5 channels. I would think that any
prospective buyer of such a radio would immedeately think "5 channels,
that is only an extremely limited number to choose from. I will probably
have interference from other users of this system".
This would (or should) hold off most buyers from investing a considerable
amount of money in such a radio, and thus would conflict with the goals
of the manufacturers.

The fact that potential for interference from other services exists only
makes matters worse.

Rob

No, but if the turtles migrate to California and jam my 2.4GHz repeater input,
their radios will be confiscated.

Since higher frequencies generally require higher power (over time), the lower
frequency transmitters are probably a better choice. You might want to even
try something in the 70cm band.

I have a problem with correct Lon/Lat co-ords being displayed properly. After playing EMail tag with the Author 3 times, and still not having a clue how to fix it, I thought I'd post here.

The coordinates Appear to be displayed in the OSGB-36 Datum, which is ok for Europe, but for them to be correct in North America, I need it to be in the WGS-84 Datum.

My home CORRECT COORDINATES Are:

43 34'32"N
80 15'19"W

But UI-VIEW Displayes it as:

43 34'54"N
80 15'33"W

Roughly off by Half a Mile. Can anyone point me in the right direction to fix this? I'd appreciate it. I know it's not a setting on the TNC, or the GPS, as it works perfectly through www.aprs.net and through WinAPRS.

TIA

It's not a datum problem, it's grade school math:

UI-View uses minutes. It has no concept of seconds. Most
navigators use minutes, and seconds are pretty much obsolete.

Your Home coordinates in minutes is:

43.34.53N 080.15.32W

Put that into your UI-View "station setup" window. The .54 and .33
values you show are not precise, and over-rounded.

.33 minutes is 19.8 seconds (.33 * 60)
.54 minutes is 32.4 seconds (.54 * 60)

You can see this is .8 seconds farther west, and .4 seconds
farther north than your stated position.

If that doesn't correct the problem, then walk the icon onto the
right position (the map may be poorly aligned) by adjusting the
values.

Many of you know that back in March of 1999, CSS purchased the rights to the Pc PakRatt for DOS and Windows source code. We made some enhancements to the Windows version, but since Timewave had discontinued the DOS Pakratt product, we didn't put any resources into upgrading it with the Y2K fixes.

Since that time, we've received requests to update the DOS version. Since the focus of CSS is Windows software and we know many of you still prefer DOS, we are offering the source code up for sale. We feel this is the right thing to do, since many of you continue to use the older computers for your TNC and logging programs.

We'd like the new owner or owner group to have experience in C and assembly, as this is what PakRatt for DOS is written in. It does compile with MASM 5.1 and Microsoft C++ 8.0 (the Visual C++ compiler).

Once you purchase the source, you can do anything you want with it, except call it PcPakratt or 'The former PcPakratt'. PakRatt is a Trademark of Timewave Technology and we cannot sell the name to you, just the source for the program.

Serious bids only and serious coders only.

I'll go $15, you pay shipping!

The right thing to do would be what HiTech did with the CP/M stuff. Pitch it out to the public domain. It's already depreciated fully.

I think you have the display set for Decimal Minutes instead of Seconds (DD,MM.MM instead of DD,MM,SS.) If you multiply the last two fractional digits ".54" times 60 you get ~ 32 seconds.

I will make it $20 if you throw in the C compiler and the Masm compiler, I junked my dos compilers years ago.

Seriously though, why not do the right thing and put the source code in the
public domain, dos is dead, even the source code is pretty useless, nobody
drives com ports that way anymore...

Do you think a transmitter that will run for several months off a watch
battery will be very successfull at jamming your 2.4GHz repeater input??

Dear sirs,

If you have a web site you can get excellent incomes joining our new affiliate program, which is changing the way of advertising on Internet.

Pro Advertising guarantees you to increase your income if you simply display a banner

on your site, chosen among those available.

You can earn from 60 gross lira up to 350 lira per click made on the banner shown on your site.

Registration will take you just a minute, and you can start earning since now.

http://www.pro-advertising.com

In the users� area you will be able to check your real income updated daily.

Pro Advertising�s goal is that to guarantee the affiliate�s greatest income and the sponsor�s maximum visibility.

OK, I see you on the map with a GPS. So your coordinates are
GPS derived. I see UI-View echoes the exact coordinates of your
GPS. So if your icon is off by 1/2 mile, then the answer can only
be, that your map coordinates (top left/bottom right) are defective.

What is the source of your map? Maybe that map doesn't use
WGS datum? Which I suspect, and the reason why winaprs would
seem to work.

"Disposable Hero" says:

Etc...

As "the Author", here's the original explanation I gave:-

****

UI-View, like all APRS software, uses degrees.minutes.decimal_minutes
NOT seconds. You are obviously thinking it is seconds.

If you open the Station Setup dialogue, and press F1 for help, you will
see -

Latitude - input your station latitude. The format is dd.mm.nn<NS>. "dd" is two digits for degrees. "mm" is two digits for minutes. "nn" is two digits for decimal minutes. NOTE - decimal minutes, not seconds. "<NS" is either "N" for North or "S for South. Example - 52.58.23N

Longitude - input your station longitude. The format is ddd.mm.nn<EW>. "ddd" is three digits for degrees. "mm" is two digits for minutes. "nn" is two digits for decimal minutes. NOTE - decimal minutes, not seconds. "<EW>" is either "E" for East or "W" for West. Example - 000.02.77W
****

I don't think there's much I can add to that other than to say that UI-View is consistent in its use of decimal degrees, it never uses seconds. What's the point of using seconds in the software when it's not what APRS uses? However, I do realise that some other APRS software uses seconds for inputting your position, even though it's not what is transmitted.

Having recently acquired a pk96 tnc modem, I'm having trouble with
implementation. To wit, while it is chatting to the comupter, sort of, in
loopback test mode (DIN connectors 1 & 4 closed), the text is garbled. I
don't have a null modem cable, do have the com port parameters set to what
the book says, and on. This occurs even just shorting the receptacle
itself, though I certainly get the same pattern with the cable I put
together. Any thoughts on what the problem may be? I am going to a DB9
from the original DB23, but didn't think this would cause trouble.
Anyhoo, thanks for any assitance...

Joe

1) That was obviously a joke.
2) Some of my neighbors' 2.4GHz cordless phones, even the ones 5 miles away,
are quite good at jamming the input.

You or I would think that, Rob, because we have an appreciation of how the different radio services all dovetail together.

The non-technical radio operator hasn't got a clue as to why they are "getting stepped on".

Even worse in the United States is the "Part 15" warning on all sorts of "consumer electronics".

The FCC requires that any type of non-licensed RF device (cordless telephones, stereos, televisons, computers, etc) have a "warning" on them to alert the consumer to the fact that the device in question MAY experience some sort of interference, but (to put it bluntly), "too bad".

Despite this caveat, there have been tens of thousands of complaints filed by consumers with the FCC about interference from everything from CB and Ham radio emitters to broadcast despite the fact that the "offending" emitter was operating according to thier specific regulations.

The manufacturers almost depend on this. They get consumers to buy "less than optimum" devices, then once they have gotten a taste of the service, they will now buy either far more expensive devices to get rid of the interference, or thye go looking for some other (read that equally more expensive) alternatives.

Some racket, huh...?!?!

> This would (or should) hold off most buyers from investing a considerable amount of money in such a radio, and thus would conflict with the goals of the manufacturers.

As you can see above, it doesn't "conflict" with thier goals, it is a part of the marketing strategy!

> The fact that potential for interference from other services exists only makes matters worse.

Yep. And unfortunately history shows that radio spectrum left unattended by regulatory enforcement is abused to the point of uselessness.

For sale: AEA PK-96 dual speed TNC.
Does 1200 and 9600 baud on the same radio.

$140 shipped to lower 48. For more info send email to
ZZZjim_cronin@juno.comZZZ (remove leading and trailing ZZZ).

Thanks and 73,
Jim

What kind of cordless phones are on 2.4GHz in the USA?
In Europe, we have DECT phones (a digital system, time-division
multiplexing on a couple of channels on 1.88GHz), but they are extremely
low power and the range is only 100m or so.

   I've got a Panasonic cordless on 2.4Ghz, and it has a range of at least
100m or so - to the end of my yard.  Perhaps more, but I've never tried it.

What a great idea Ken. Why don't you pay CSS what they paid for the product
and then you can put in into the Public Domain?

Tim,

You are asking for divergent features. If you want longer range, then you have shorter battery life. If you want smaller, then you get more expensive. The cellphone and wireless phone industries probably won't be of much advantage to you, they really don't go after the really long life scenarios. For them, 8 hours of talk time is a lot, and that's done with a battery that's significantly larger than a watch battery.

About the only thing that I can think of is to implement a device with an extremely long sleep period that wakes up a receiver periodically (once an hour?) to see if a pilot transmitter (you) is in range. At that point it can go into a high power mode until you find it or it loses the pilot.

But still, anytime that you are transmitting, you are using a lot of power. A 50mW signal just isn't going to be heard from far away and is going to put a pretty good load on a battery.

The alternative is to follow the cellular solution and put up a lot of listening posts in the swamps.

Who knows what they paid...? When it was a reasonable, small amount they would probably put it in the public domain themselves... it very much looks like a desparate last attempt to recover some of the money spent on a program nobody is interested to maintain anymore.

The "range may be limited" but the sensitivity of the system is also in excess of +20dB of receiver stage gain before going into a 0.16 microvolt sensitive receiver. The radios that are made for this band only put out 1W at "high" power. Do the math - what kind of sensitivity do I need to have a 25 mile (or 40km) coverage range? I did. That's pretty much going to pull in nearby, "weak" transmitters too.

Rob et all:

There is no desperation here at all. CSS is a no-debt software company and has been in business 12 years. If we don't sell it, we stay in business as we are doing now. It's just the DOS version doesn't get any work done on it.

What I am trying to do is allow some ham or group of hams an opportunity to support the DOS product and possible make some extra money for THEM since WE are focused on Windows.

We had discussed putting it into the public domain or with a GNU license but decided that the resources on supporting it would take away from our Windows products.

Fact: There are 80,000 Pk-232 that were sold by AEA
Fact: Each one of them had PcPakratt lite included.
Fact: Each version of PcPakRatt lite and PcPakRatt II has Y2K issues

So if just 1% of the hams who own PK-232s bought a $25 upgrade of PakRatt DOS, that's 800 units of sales for revenue of $20,000. If 2% bought the upgrade from a ham, that's $40,000 of revenue. From the information I have, I believe about 10%-20% of hams that have computers still run under DOS and are happy with that.

I'm looking for around $5,000+ for the source code.. I believe AEA invested about $100,000 in the development process. This does include the source for PakRatt Lite, PakRatt II for DOS and the PK-270 commercial version of the DOS software.

And there is market potential for 1 or 2 future upgrades for the DOS version, but we want to focus on Windows, not DOS.

There is one problem with these best case "off the cuff" figures.

AX.25 packet is dead. It is dying so fast, no one knows what
to do, product wise. Here locally there is one node, one frequency
remaining, and I can't find anything on HF packet except BBS
diehards.

Visual Basic and Java, are the two programming languages of the PC that are doing well. C is fading fast, and Object Oriented languages are the programming style of choice today. C++ had a beginning surge, but Java has pushed it from the scene.

The big mode today is the PSK31 and modes that use the soundcard on HF. This is even becoming popular on VHF with all-mode rigs.

So the whole concept of AX.25 is a bad investment strategy for all older DOS C software, in my opinion.

But let's take the figures...

You may very well make 20k the first year, and all will be well, but you also have to factor in the post-purchase costs. Say you set up an online web page to sell the software as downloaded credit card purchases. You don't want to have to ship this stuff (floppy and manual costs). Figure ISDN speed as a minimum, and that will run you about $300 a month. Then the credit card online store gets 10% of sales, now we're down to $18k. Given the internet connection for one year ($3600) that leaves you with $10 k, or about $5 an hour income for the year. Then there's taxes, figure 33% or $6600, and now you're left with $3400 or about $1.63 an hour. So you are going to need two years to show a profit. If there is only one node on one frequency today, how many will there be a year from now.

And no, you can't legally use your cable-modem for distribution.

I think there may be a case for liquidating the software. Just put a GNU sticker on it, and upload it to a Linux distribution site. Zero cost, and you are done with it. You can even claim a tax credit.

Dean.

The source code supports the multimode protocols in the PK-232, not just the AX25 packet side.

So it does CW, RTTY, ASCII, FEC, Pactor, etc... anything that the TNC supports..

And someone could add PSK-31 DOS support it it, by using soundcard code and using the TNC or TNCs serial port for the keying circut, like we're doing with the next release of Pacterm and PkTerm. It would also be good for a dos based contest or logging program that wants to add host mode TNC support to it for the PK-232.

Rick - W4PC

My real name is Gabrielle, K6CAT. I'm currently playing in the all nude Dean Martin retrospective show in Vegas. Tell the waiter you would like to see "Gabby the Cat"! I'm also on the can-can net at 4am when we travel back to LA on the bus.

But I disagree. There hasn't been a valid discussion on here in 5 years, and my callsign is not going to help.

Also - that program could support the PK-900 with a little tinkering.....and
additions here and there....
ACARS is also supported by the PK-900, and that should be considered in the
next version of whatever software can be redone......

0.16 uV into 50 ohms is about -123 dBm and assuming NBFM bandwidths
and even a totally noise free 20 dB preamp will not improve the
sensitivity much, due to the thermal noise of the surrounding ground
at 300 K (or about -174 dBm/Hz noise density).

>The radios that are made for this band only put out 1W at "high"

>40km) coverage range? I did.

While only a few mW of radiated power is required to get into a -123
dBm receiver at this distance, this would require a true line of sight
path with at least the first Fresnel zone free of any obstacles.

>That's pretty much going to pull in nearby,
>"weak" transmitters too.

The thread started about tracking turtles in a swamp, it is quite
unlikely that there are going to be clean line of sight path to the
repeater receiver antenna. While the signal may bounce nicely around
in urban areas, I do not see how you would get any measurable signals
out of the swamp, with very little reflecting surfaces and vegetation
absorbing the direct radiation.

If the PK-900 properly supports the decoding of ACARS, then surely it
should display it in any terminal program, why should it need a host
mode program?

I'm not suggesting your company desperately needs the money, I just think you are desparately trying to recover some of the money spent on a dying system.

>What I am trying to do is allow some ham or group of hams an opportunity to
>support the DOS product and possible make some extra money for THEM since WE
>are focused on Windows.

If that is what you really want, then you should give the sources to someone at little or no charge, and sign a contract covering the price at which upgrades are to be sold and the fraction of that amount that is to go to CSS (maybe up to a maximum).
Then the risk stays with you, and you still allow someone to make money and get your fair share of it.

>We had discussed putting it into the public domain or with a GNU license but
>decided that the resources on supporting it would take away from our Windows
>products.

When you put it on a server, with a GNU license and a clear indication that you are not going to do further support, you will need no further resources to support it. There even are special websites for "orphaned software" to do exactly that. Others can then take up the opportunity to step in as a new maintainer/coordinator.

>Fact: There are 80,000 Pk-232 that were sold by AEA
>Fact: Each one of them had PcPakratt lite included.
>Fact: Each version of PcPakRatt lite and PcPakRatt II has Y2K issues

Fact: Y2K has now been underway for some 300 days.
Probably most users of non-Y2K-aware programs by now have realized that something needs to change, and when the original distributor if the program does not release an upgrade, the option is to change to another program. If Y2K issues were a motivation to buy an upgrade, you are at least a year too late with this move. The "impulse" Y2K upgrade buyers are now all gone. The Y2K patch should have been available, or at least announced, at the time the problem occurred.

I have a TAPR TNC2 that radiates wandering spurious oscillations on 10 meters and below. Seem to radiate strongest thru the RADIO DIN connector. This connector is "floated" above board ground by a 10 uh inductor. Any fix known for this? Thanks.

Or how about mounting an array of solar cells on the turtles' backs to
recharge a small NiMH battery? You could mount one on each hex cell in
the turtle's shell.

I understand that there is a nice pond that you could use for testing
these 2.4Ghz "devices" on ROCHEDALE LN in Los Angeles.

Someone posted information on this just last week:

****

Poor Man's Packet and other Baycom-like devices are not
TNCs. They are modems, with the protocol processing done in
software. Modern implementations do all the processing in
software.

The TCM3105 modem chip these designs used is long obsolete
and unavailable in surplus. MX614 is a replacement, albeit
not a drop-in one.

****

> With greetings SQ9ETF Slawek JO90PG
> sq9etf@kki.net.pl

People are working on PIC-based MX614 "devices"(myself included). I
believe the TAPR PIC-encoder comes with an MX614. The problem is that
the PIC-encoder's 16F84 chip apparently is too gutless to do both
transmit and receive synchronous encoding/decoding(so you can just use
your PC's/PDA's asynchronous serial port to send packets!) - and you
must use a more powerful PIC device?

>Do you know which implementations have this problem?

I have no exact list. As you know, some software uses fixed buffer sizes (and we have to hope that appropriate bounds checking is in place), while others use dynamic buffers. Certain NOS versions will just extend the buffer as long as data is received.

(but the same is true for transmit frames. you can easily crash many NOS systems by sending a long series of large PING messages on a halfduplex channel. they will happily receive all the pings and queue replies on the transmit queue that can never be sent because you are transmitting. after some time they will run out of memory)

After spamming six different newsgroups, five of which do not deal with scanning, I can see why you dont have the time or inclination to revisit each one to look for replies. You just do your spamming and run.

Next time, post your question to the appropriate newsgroup (rec.radio.scanning only) and be prepared to return to it to read replies and maybe even participate in the activities of that newsgroup.

Try to be a good netcitizen.

I have bad feelings about this MURS thing...

What I can see happening on MURS is the same thing that happened on 11m CB. MURS'ers will buy inexpensive 2-meter FM amplifiers at hamfests and connect them between their MURS radios and their antennas. So much for the 2 Watt limit! No one pays attention to the 5 Watt limit on 11m CB either... they use 10 meter amps. With 2m amplifiers so commonly available for such little money, I think this will happen virtually overnight. MURS also allows external antennas. Soon, there will be MURS'ers using modified 2m directional antenna arrays and high-power amplifiers to work bootleg VHF DX.

Someone else has already pointed out that the MURS radios will be merely the existing "color dot" type radios re-hashed (including some of the frequencies that were once "color dot" frequencies, such as 154.600 MHz). This could pose a problem too. Many of your favorite fast food joints, such as McDonald's, Wendy's, and so on, use some of those same frequencies for the two-way radios in their drive-up lanes. Can't you just picture the MURS CB'ers, running high-power amplifiers, giving fits to the people working the drive-up lanes? It's gonna happen, folks!

There are countless thousands of "color dot" radios wasting away in closets and drawers since the advent of cheap and effective FRS radios. FRS offers 14 channels vs. one or two channels, PL tones for a degree of privacy, they cost half or less what the "color dot" radios cost, they offer similar range but the UHF signal seems to pass through buildings better than the VHF does, and FRS radios run on common household batteries instead of the usual NiCd packs. I guess the only big draw for MURS is going to be the ability to (illegally) use big amplifiers and to use powerful antenna systems. MURS will be a boon to the bootlegger, but of no value to the intended users. The FCC has bungled again!

Flame away, folks. I'm wearing my Nomex firesuit...

I started playing with UI-View.  looks great, but how do you zoom in and
out?  Do you have to have different maps for each view?

Anyone know of where I can get a detailed map of Southwestern Ontario?

True, and some of us got in just to fly our RC planes on 6M. But, with good
Elmers in the hobby, we can take that Codeless Tech and show him other,
wonderful aspects of the hobby that 2m, low-power simplex can't compete
with.

Don't jump all over me now, but I have been a ham for
30 yrs and am just now fooling around with digital modes.
Eventually I will try psk31. I just started using an older
MFJ 1278, and am hearing stations on 20m packet.
Is there a list somewhere that tells me what the purpose of
the station is? For instance, I heard KJ6EO last night, and
really could not tell what was going on.

Also regarding psk31, could I expect an old 486DX with
32mb of ram to work with any of the software out there?
If so, which ones?

Thanks

Doug, N4IJ

K5DH,
  I agree, MURS is going to be subject to all the abuse that other bands are subject to. It's a shame too, it could be a fantastic oportunity, if everybody 'played' fair. There's one 'happy' thought, though. Since it's VHF, it should be easy to 'DF'.

The only good thing I see about the new CB radio (MURS), is that
you can now talk direct to the McDonalds clerk! It's a revolution!
Course, how do you get rid of that pager stuff right next door...

Oh well.

> with.

     I have to agree with the fellow in the QRZ article, though...it's
not so much of the impact that MURS may have on Amateur Radio's census.

     It's going to be the impact of all those (now) bootlegged 2M rigs
that will be "opened" for MURS use.  We (Amateur Radio) are already
suffering the burden of the FCC's mistake in that we can't simply
procure equipment for our use in some parts of the spectrum.  WE are
the one's paying for the sins of the CBers who moved Amateur linears to
11 meters.

     I can see the price of 2M rigs initally dropping with increased
sales, but then skyrocketing after the FCC mandate type acceptance and
very strcitly controlled "wideband" VHF gear.

     The people that MURS will appeal to MAY be the types who would
have considered Amateur Radio if not for the exams, but the limitations
on the technical specs and the rapid proliferation of gear will quickly
fill those 5 channels.

     I live 25 miles from any major metropolitan area (if you consider
Chattanooga THAT metropolitan!), yet I can monitor a fair bit of FRS
```

traffic. I can imagine what the MURS channels will be like after they
find out how to put an external antenna and a Mirage amp on them....

Here we go with another CB fiasco.

     And your suggestions along with $2.00 will get you a cheap cup of
coffee at Starbucks.  The "non-radio-savvy" general population is going
to thumb thier nose at that faster than you can say "What's yer 20,
Good Buddy...?!?!?!"

     Channel 9 on CB is supposedly reserved for EMERGENCIES and
traveller assitiance ONLY.  That's LAW.  What do you think 99.99% of
the MURS users will say to your "suggestions"...???

     That other .01% will finally figure out that MURS is not going
to "deliver" for them, and move on to the Amateur licenses that they
were trying to avoid in the first place.  Only they will have spent
money on useless radios that they SHOULD have or COULD have spent on an
Amateur ticket and avoided all that silliness in the first place.

True for all versions of NOS where I've had access to sources.
SNOS won't do this, it has some "this makes no sense so drop
the frame(s)" heuristics, as well as some "hmm, buffers getting
tight, so lets toss some stuff and let the protcol retry" heuristics.

> (but the same is true for transmit frames.  you can easily crash many NOS

Possible with UI frames. With I frames, the versions of NOS I know
about will ignore anything outside the current window, so there is a
gauranteed max buffer pool required (which can be pre-allocated),
and incoming frames outside the window are tossed.

Certainly possible over ethernet, but that doesn't apply to ham
radio transmissions (smile).

Steve! Long time, no banter.

Anyway, you have a point. However, we should at least try to see if we can't make this thing work out. I'm hoping it can - in fact I've been kinda "banking" on it.

> Channel 9 on CB is supposedly reserved for EMERGENCIES and traveller assitiance ONLY. That's LAW. What do you think 99.99% of the MURS users will say to your "suggestions"...???

I don't know. Things on FRS/GMRS have not been that bad. The big problem with CB was the easy/cheap availability of high-power amplifiers. Also, the CB debacle occurred BEFORE the Internet. Most technical sociopaths have moved onto the Internet, where they can harass a much larger population than a folks on 40 channels in their 50 square mile area.

> That other .01% will finally figure out that MURS is not going to "deliver" for them, and move on to the Amateur licenses that they were trying to avoid in the first place. Only they will have spent money on useless radios that they SHOULD have or COULD have spent on an Amateur ticket and avoided all that silliness in the first place.

The problem with amateur is not just the license "restriction". The problem can be summed up in two words - The Internet.

The reason why amateur packet died was basically four-fold. In order of importance, these factors were:

1) Speed. Once folks could hook up to the Internet at 14.4Kbps, and it became clear that Hams couldn't muster building a 9k6 network - it was pretty much all over for ham packet radio. Now that we have Cable Modems and DSL connections - this problem is worse(except for certain applications - which I'll touch on in a moment).

2) Applications. Most of the applications that people want to use are TCP/IP-based; For desktop applications, most are not unusable at 1200bps. The exception has been APRS - which is really a combination of mobile and desktop applications.

3) Business-oriented communication restriction. Can't get stock quotes! Also, the PBBS-cronies feel that digital data is somehow "special", and should be treated "differently" than voice data. So they set up a system where they could play "God" and exercise "control freak" ideas. I.e., they could "edit" content to make sure that the pro-code voices would be dominant ;^0 They also feel that using the Internet is "cheating". Oh well.

4) Frequency blow-hards. Transmitting with exessive power, these guys would dominate frequencies, and eliminate implementation of more efficient cellular-type Internet-backboned systems.

So, you will ask, why should things be any different now? Well, the explanation for why problems 1) and 2) are no longer so significant can be summed up in 2 words - mobile applications. PDAs are now much more powerful than they used to be, and character-based applications work fairly well with them at 1200bps (e-mail, newsgroups, chat, stock quotes, etc.). As for problem 3), well that just isn't a problem anymore with MURS - sorry all you control freaks out there! And problem 4)? well, with a 2w ERP restriction, we should get some relief here as well vs. the Amateur service.

I've been working on a national Internet-backboned MURS packet radio system for portable applications for a number of months now. Despite what the old PBBS-cronies say, most of the obviously "non-business oriented" applications should be usable. I.e., stock quotes are obviously out. However, ordering a pizza on digital should be treated the same as ordering a pizza on voice - so THAT will be OK ;^)

P.S. Shhh... I left a booby trap in the text above - let's see if some old crony won't fall for the bait. It relates to APRS and TCP/IP.

But think how many antennas and amps you can sell.
(Hint, some or all of the "pro-MURS" posters are in that business.)

Two 1200 baud frequencies. How totally useless!

<MURS propaganda deleted>

We lost the folks who were not interested in radio.
Building a 9k6 network became pretty much trivial ten years ago.
Sorry you have been off air so long.

> 2) Applications. Most of the applications that people want to use are
> TCP/IP-based; For desktop applications, most are not unusable at

Many tcp/ip applications work well at 1200, and many more work well at 9k6.
APRS is not a tcp/ip application.
You are *really* out of touch with ham radio!

> 3) Business-oriented communication restriction. Can't get stock
> quotes!

Straw man. Can't do busines over ham radio. Duh ...

> Also, the PBBS-cronies feel that digital data is
> somehow "special", and should be treated "differently" than voice

Digital *is* treated differently in the regulations.
Perhaps you might read them some time to understand how, and why.

> So they set up a system where they could play "God" and
> exercise "control freak" ideas. I.e., they could "edit" content to

I guess you have no clue at all how the store and forward
network works. Nobody can "control" what traffic moves
around the network. There are no choke points. Anyone
can set up a system and bypass any "control freak".
In fact that is what always happens ... it's trivial to do.
It is an open network. Was designed that way from the start.

> make sure that the pro-code voices would be dominant ;^0 They also

I personally prefer ASCII to BAUDOT, but 16 bit codes work fine also.

> 4) Frequency blow-hards. Transmitting with exessive power, these guys

Nonesense. Do you *always* lie, or just sometimes?

<MURS blather deleted as usual. This newsgroup is for ham radio>

> ------- Stewart - N0MHS --------

Your business making any money off MURS yet?
No? Imagine my surpise!
imode (the DoCoMo model) makes MURS moot.
Except, perhaps, for something to stick in the kids christmas stockings.

My version of NET also does not have this problem...
We had some jerk on the channel that reguarly exploited this problem
to crash the node, so I fixed it. Both the packet length is limited
(not to a fixed low value of course, but depending on the MRU/MTU selected
for the interface) and the transmit queue has soft and hard limits.

But the SCC driver in NOS was derived from an earlier version, that one
still happily expands the mbuf as required.

>> after some time they will run out of memory)

>Possible with UI frames. With I frames, the versions of NOS I know

Of course one uses UI frames.

I'm puzzled on how you are going to create a packet radio system with only two frequencies for access, where on hamradio we have needed some 12..20

frequencies to get any useful cell structure without excessive hidden transmitter problems.

Who is going to introduce a radio service with only 5 channels anyways? Is that meant to be a discouragement to any sensible person considering to buy such a radio, or a first allocation that is to be extended as demand shows?

This will mean you need technically sound equipment. Like 20 year old 2M rigs re-aligned to the new band. Not like "modern" 2M rigs that tune from airband to vhf-high.

I'm amazed that someone would buy a transceiver, supply, antenna etc for that band, all to have only 5 channels.

When that would be done here (it happened decades ago on CB), there would very quickly be a "strong voice" to extend the number of channels. And when that would not be granted, (part of) the community would allocate these "extended channels" all by themselves.

In the seventies, before CB was legalized, a novice license was introduced here to allow CB-type users to "step up" to licensed amateur radio.
It was introduced with a 2-year validity and a 6-channel limit on 2M.
The idea was that within those two years one would get a regular amateur license.

Well, the 2-year limit was dropped before the first licenses expired (hence the first issued licences are still being extended today) and the 6-channel limit was the next to follow. The allowed band was first extended to the primary FM part of the 2M band, and later to include SSB and 70cm.

Later there was a "legalized CB" regulation where one could use 22 channels on 27MHz with FM modulation and 0.5W output. It has been extended to 40 channels and 4W.

Dave,
I'd go with a TNC rather than a modem (Baycom etc.) as it is MUCH more versatile. There are lots of used ones around... The PK-88 is an very reliable unit that I am sure you can get for a decent price. Many have been in service for years.
The multi-mode TNCs (PK-232 etc) are nice but if you do ever get into

the 'other' modes you'll want to buy a packet only TNC to monitor FM
packet...
There is LOTS of packet shareware around for both MAC and PC. Even DOS
based APRS! I use onbe that is built into my logging software...
something to consider, a single package logging, packet, rig / antenna
control software. There are some that will even run on a 386.
Happy hunting
73

horseshoestew@my-deja.com wrote:

> Steve! Long time, no banter.

Don't worry....Lennie's been keeping it "flamingly hot" here.

> I don't know. Things on FRS/GMRS have not been that bad.

Things have "not been that bad" because the average FRS radio is just a toy you can buy at Wally-World, and Amatuer equipment that could be made to operate here is too cost prohibitive to the John Q Citizen that want a hobby type of radio. Also, $85 license fees and pay-for-use repeaters pretty much discourage GMRS applicants.

The technical diffrences (power, external antennas) and cost (Amateur HT's at under $150 and moviles about the same at 50 watts) and no license will make all the difference.

I already am keenly aware of the gross abuses of the itinerant channels in the 151MHz range. MURS will be NO different.

> The big
> problem with CB was the easy/cheap availability of high-power
> amplifiers.

No, the problem with Class D CB was the fact that the FCC did not heed the warnings of the ARRL and others in 1958 and placed a radio service that was intended for short range, low power operations on a part of the radio spectrum where low power signals can propagate hundreds, even thousands of miles with very low power and mediocre antennas.

It was only bound to happen that those looking for a way around Amateur Radio examinations would find thier way here. And once the solar cycle opened 11 meters up and people suddenly found themselves talking across the continent, the floodgates were opened.

The linear amplifies and higher gain antennas didn't come till later.

> Also, the CB debacle occurred BEFORE the Internet. Most
> technical sociopaths have moved onto the Internet, where they can

50 square mile area.

This is partly true, but if the Internet has siphoned off these "sociopaths", then why is 11 meters still the cacophony of fouled-mouthed RF that it is?

Trust me, it won't be long before this type activity gravitates to this new service. All it will take is two guys arguing over "who (was) there first"

I don't doubt this for a minute. Except for certain "Amateur Specific" applications, I don't think PACKET is really worth the effort, save for it's intrinsic portability.

> 2) Applications. Most of the applications that people want to use are
> TCP/IP-based; For desktop applications, most are not unusable at

> 3) Business-oriented communication restriction. Can't get stock quotes! Also, the PBBS-cronies feel that digital data is somehow "special", and should be treated "differently" than voice data. So they set up a system where they could play "God" and exercise "control freak" ideas. I.e., they could "edit" content to make sure that the pro-code voices would be dominant ;^0 They also feel that using the Internet is "cheating". Oh well.

This is codified into law. Amatuer Radio was MEANT from the "git-go" as a NON-COMMERCIAL radio service. It was neer intended to further business needs.

> 4) Frequency blow-hards. Transmitting with exessive power, these guys would dominate frequencies, and eliminate implementation of more efficient cellular-type Internet-backboned systems.

Unfortunately, EVERY radio service has these idiots. Luckily they are less prolific on Amateur Radio because they at least have the spectre of enforcement hanging over them.

The unadulterated BS that occurs on 11 meters does so because there is little, if any, likelyhood of enforcement. In the early days of CB, we all stuck right to the clock on 5 minute times, use of callsigns and no profanity, etc. Once the FCC clearly couldn't or wouldn't enforce CB regulations, the gloves came off.

Too bad. It was fun while it lasted.

> So, you will ask, why should things be any different now? Well, the explanation for why problems 1) and 2) are no longer so significant can be summed up in 2 words - mobile applications. PDAs are now much more powerful than they used to be, and character-based applications work fairly well with them at 1200bps (e-mail, newsgroups, chat, stock quotes, etc.). As for problem 3), well that just isn't a problem anymore with MURS - sorry all you control freaks out there! And problem 4)? well, with a 2w ERP restriction, we should get some relief here as well vs. the Amateur service.

Stewart, WHAT makes you think that if people are going to be lawless on 11 meters, that they will behave above 11 meters?

> I've been working on a national Internet-backboned MURS packet radio system for portable applications for a number of months now. Despite what the old PBBS-cronies say, most of the obviously "non-business oriented" applications should be usable. I.e., stock quotes are obviously out. However, ordering a pizza on digital should be treated the same as ordering a pizza on voice - so THAT will be OK ;^)

This would be an interesting concept, and one that SHOULD have been applied to GMRS and it's interstitial frequencies.

I recently did some research on GMRS licenses, and intentionally chose the most populated states of California, New York, Florida and Ohio for my numbers.

California has the most GMRS licensees by far, but even at that, there are only about 420 distictive licensees. Several licensees hold multiple callsigns, therefore I counted ONLY the applicant, NOT the number of callsigns held. Many of these licensees were authorized on more than one pair.

Allowing for 10 "units" per licensee, that's only 4200 potential users at any one time in a state of (?) 25 million people? That further breaks down to about 600 users per repeater pair (assuming that each licensee is using a repeater), however each pair may be re-used due to geographical restrictions that I am sure you acknowledge at 70cm.

Ohio only had 35 licensees. Spread out over 7 pairs, that is 50 users per pair. Again allowing for re-use of a pair due to geographical separation, that number becomes even MORE diluted. This is HARDLY good spectrum management.

The real "kicker" to this is that many of the users are REACT organizations, and they pretty much congregate on ONE particulare GMRS pair. (462/467.675).

What am I getting at? We already have the spectrum in place for EXACTLY the kind of service that the proponents of MURS are trying to create. Except the ACTUAL purpose of MURS is NOT spectrum planning...it is SELLING RADIOS!

If the FCC were to drop the GMRS license fees to a reasonable $10-$25 dollars per 10 year license and ammend Part 95 to allow the use of the interstital frequencies for the data/telemetery/etc functions proposed, the radio manufacturers wouldn't be able to keep them on the shelf. Repeaters would proliferate, data could move simultaneously with voice traffic, and we wouldn't be facing the likelyhood that we (Amateurs) will be faced with bootlegging of Amatuer gear on business and Public Safty frequencies.

Adios

Steve.

It's not the people who might populate MURS for it's intended use, Rob. It will be those who "wink wink...don't cut this wire..." buy these radios to use the "channels" outside of MURS.

> In the seventies, before CB was legalized,

It was "legal" in the US since the 50's, but deregulated in the late 70's/early 80's. I do not recall the exact timeframe that the FCC washed thier hands of it.

The MURS system as it is now will be a US only service. The rest of your post was obviously not relative to US Novice licenses as the data concerning license terms, allocations and authorized modes was all erroneous as it pertains to the United States Novice.

This is of course not true. A TNC limits the versatility that a bare modem has: a modem can send and receive anything the PC is programmed for.

A TNC can sometimes be convenient because the software you want to use assumes one, but usually it will just be a drag. It has parameters that can be set wrongly, and operation modes that it will drop out of when you least expect it.

Ouch... don't want to think about the energy that has been wasted over that period of time!

If you want to go for a TNC, at least use a full-CMOS version, not those NMOS tea-warmers.

Rob

You should be able to pick up a used KPC3 or PK12 for a good price. I
wouldn't get the PK88 as it does not have the newer features of the other
two that you may want to have as you get more into packet. IMHO

Hi Rob,

Well, you WERE discussing MURS which is a US service. I only caught on to the "not US" when I read further into your post then checked your domain. To be truthful, I missed your call in the trailer at the end.

I apologize for the confusion.

For the average ham, using the average PC, with the average Windows installation on it, using a TNC can save an awful lot of hair tearing!

The simple fact is that, in a multi-tasking environment, other hardware devices can, and do, interfere with devices like Baycom modems that generate a large number of hardware interrupts and require a low and consistent interrupt servicing latency.

The use of Baycom modems has, if anything, contributed to the demise of packet, simply because they are responsible for so many terrible quality signals, and so many relatively deaf systems. (However, the use of sound card modems seems to have pushed "deafness" into a whole new era!)

Yes, I know Baycom modems work fine on a 286 running DOS, but that's no longer representative of the average shack PC. (Cue for someone to pop up and tell us how wonderful Linux is? ;-)

Given the low cost of a second-hand TNC, for a beginner it has to be the best way to get started on packet.

I'm not sure if this was urban legend or not, but supposedly FRS
resulted from some heavy lobbying activity by R/S to create a new market
for radios.

Yup! IMHO the preferred rigs to use are going to be those cheap (new/used) Ham 2m rigs. Why? That's not hard to figure out, 5 watt HTs and 50 watt mobile rigs, both with adjustable power settings, and they are TOO easy to modify for out of band operation with a simple wire cut or chip diode removal. When the "legal" MURS channels are too filled up, intentionally jammed, taken over by channel control freaks, etc., they will drop down to the civilized Ham 2m band.

Its bad enough that we have pirate 11m operators on 10m, now we are going to have pirate MURS operators on 2m. Just wait until they discover they can talk all over a large city using the installed base of 2m repeaters, you will never be able to get rid of them permanently then. You can cut an antenna to work the low frequency MURS channels, and the high end of 2m easy. Then there are all those cheap used Mirage 2m brick amplifiers, at the same Hamfests the pirate 11m operators go to for 10m gear to buy to run on 11m, oops. Just think about that MURS operator using a modified 2m rig, and a nice 300 watt Mirage 2m brick amp in the trunk. That's the same situation we have now, with the 11m pirate using a modified 10m "export" rig, with a 300 watt HF amplifier in the trunk.

Why buy???
On my web page I have a working APRS program that uses the US Census bureau's on-line Tiger mapping service. Neat service. link to their cgi script with the center in lat/long and the desired resolution and it sends back a gif of the map.
Mine is minimum right now and needs to be expanded.
The really neat thing, at least to me, is it runs on both Windows, Linux/Unix and Mac.

Well I think Mac, haven't tried on it yet.

What causes this amazing bit of magic. It is written in Tcl/Tk!!!! A
really neat scripting language available FREE from sources listed on my
page for about EVERY popular OS... Also the source for it is available,
so it isn't proprietary, like Java.
And since it is a scripting language, my program is distributed as
source code.
Tcl/Tk is really easy to learn, plenty of good books to learn from. Take
my code as the base and customize it to be what YOU want. Not have only
what somebody else thought was the right thing.

Check it out....

Hi all.

The following software's have been added / updated on my download page.

MMTTY Ver 1.59 (Recent Upgrade) by JH3HHT
TS870S New CAT control software by EC4DFP
LOGGER Ver 7.09 by K4CY

There are other radio software's available as well.

http://www.g3vfp.co.uk

Best Regards,

Dave G3VFP.

We are in agreement(amazing!).  Another benefit to using data on UHF
vs. VHF is that those inexpensive TEKK UHF data radios will work there
at 9600bps with low TxDelays, and are virtually plug and play.

On VHF, for plug-and-play, you are basically stuck at 1200bps.  Even if
you do mod a commercial radio to bypass the varactor and discriminator,
in order to run at 9600bps, you still will have high TxDelays - so it
is not worth it!

It has been working out pretty well.  We just need to be able to run
data on some of the UHF channels.  I'll settle for 1 interstitial
GMRS/FRS channel.

You mean on a.a.r.p.? Egads. I dropped that newsgroup like a bad
habit. Actually, it WAS a bad habit, nothing productive was being

accomplished - except maybe for sunken Russian submarine raising
theories ;^)

> > I don't know. Things on FRS/GMRS have not been that bad.

The thing is - why would an abuser worry about paying/getting a license
anyway?

I find it odd that there hasn't been any problems. My theory is that
it is too much trouble for the CB abusers(I'm not talking about all of
them) to mess around with the high feedline losses that occur on UHF.
You just can't go down to Radio Shack and use 75 feet of their crappy
RG8 coax, and expect things to work the same that they did on 11m.
Additionally, a good high-gain UHF antenna will cost about $150 - on
11m, you could string wire for the antenna! But I think the most
important factor is the lack of cheap high-power amps, like the 11m
twerps got their hands on.

>   The technical diffrences (power, external antennas) and cost
> (Amateur HT's at under $150 and moviles about the same at 50 watts)
and
> no license will make all the difference.

I hope not - but you are probably right. Feedline losses aren't that
excessive on VHF, and 50W IS enough to bother a lot of people -
especially through a good high-gain antenna. But the lack of cheap
antennas might be the saving factor - the jerks won't be able to afford
a good enough high-gain antenna to make 50W obnoxious enough to enough
people. Besides - they already have "invested" in their 11m equipment -
and are "set in their ways" on 11m.

>   I already am keenly aware of the gross abuses of the itinerant
> channels in the 151MHz range. MURS will be NO different.

That is scary. Then you are probably right. I just hope it won't be
as bad as CB got(I haven't been on 11m since ~1987 - it was AWFUL back
then). Maybe it will make VHF fox-hunting a popular sport again.

Is it correct English/American to use the term "software's" (or "softwares") when discussing multiple programs? I always believed this is in error, and typically written by French people writing English. "software", I thought, is not a countable object about which you can talk in plural form.

But now that I see a person with an English callsign posting this, I am wondering if that is really true...

Nothing in my post was about any US service or license, as you could
have guessed from the many references to "here" combined with my callsign
and domain name.

I think it's like sheep.
One sheep, two sheep, a herd of sheep, we have all heard of sheep.
English tends to lose number and gender quite often ... forgetting
it's roots in OF, ME, et al.

But there is "warez" ... presumably from "wares" meaning things
for sale via a reversal (like cleave to and cleave asunder) and
the similarity to "software".

If you're only going to "talk to yourself", then you'll need two
radios, two TNCs, and two antennas.

You only need a "data radio" if you are going to go faster than
1200bps.  At 1200bps, you can pretty much just use any old voice
radio.  Some are better than others, of course.

Also, if you are going to want to go faster than 1200bps, the cost of
the TNCs will at least double.

Low and consistent interrupt servicing latency has little or nothing to do with multi-tasking. On any multi-tasking system it should be possible to write a device driver that includes an interrupt service routine which is quickly being called when a hardware interrupt comes in. It should not be necessary to do a process context switch for that, and so it does not matter if the system is single- or multi tasking.

There will be a user process that hands over data in managable chunks (packets, in this case) to a device driver, which in this case will send the data bit-by-bit as driven by the interrupt handler. The user process is not involved in that.

Now of course we all know that Windows does not really shine when low interrupt servicing latency is concerned. But that is because of the fanatic attempts at backward compatability with 16-bit mode, not because of multi-tasking! The mode switches disable interrupts for a long time, and the overhead of 16-bit interrupt handlers being called while in 32-bit mode (and the reverse) is high.

This explains why it works much better in Linux, but also in Windows NT.

The problem with Baycom modems in Windows does not necessarily result from context switching. The problem arises because other device drivers, in particular video card drivers, will disable interrupts for too long. Also PCI busmastering can cause problems. Even when the Baycom driver is running in ring 0, it is not protected from other badly behaved drivers also running in ring 0.

>There will be a user process that hands over data in managable chunks

I don't really follow that, at least not in relation to a Baycom modem, because the interrupt latency problem that occurs has nothing to do with handing over chunks of data. The problems occur at driver level. Incoming data is received as a bit stream, and there is a clock (usually generated via the UART THRE interrupt) also running at bit rate. So that's around 2k time-critical interrupts a second. It obviously doesn't need much to get in the way to result in a bit being lost or misinterpreted.

Whew, didn't think I'd ruff up any feathers, guess we are passionate about our packet.

I still say you are going to have trouble with a "Baycom" type modem if you want to run it from a logging program, APRS software or connect it to a GPS!!! Nothing to do with all that internal system stuff... its a matter of software / hardware compatability!

At a "home' station a few watts up in heat is meaningless.... Sure low power consumption is needed for portable work. But I don't think that was mentioned in the original post. The heat generated by my 50 amp power supplies and linear makes the 88's loss meaningless (come on, it barely keeps my coffe cup warm, the linear does a MUCH better job (Hi))!!! And my point was that it has been operating for years and has never faltered.... and there are LOTs of them out there!

Yes there are 'better' TNCs out there (jeese the 88 is an ancient design) but, for simple V/UHF packet / BBS / DXCluster the 88 will work just fine.

Nice to see differing views, makes the world an interesting place?

Hi there,
While cleaning out the shack I found a PacketMac kit from around 1993. It's 90% unbuilt.

This is a baycom like modem for the Macintosh.

Any one interested?

I'd rather not ship it but will if someone pays shipping.

I'm in San Francisco.

Jeff

In article <slrn8uqlau.16v.nomail@linux.pe1chl.ampr.org>,

> Who is going to introduce a radio service with only 5 channels anyways? Is that meant to be a discouragement to any sensible person considering to buy such a radio, or a first allocation that is to be extended as demand shows?<

I think you need to understand how the Rule Making process works here, Rob.

A petitioner approaches the FCC, in this case commecial entities looking to sell radios, and makes a proposal for certain services. The FCC looks to see if the proposal can be accomodated under present regulations, then either dismisses it as moot, or assigns it an NPRM, or "Notice of Proposed Rule Making" number.

This NPRM is then published in the Federal Register and the citizens are allowed to comment on the matter. After the initial Comment period, there is a "Reply Comments" period, after which the FCC then takes the matter for action.

In this case there was a proposal by manufaturers to create a new radio service on certain discreet VHF channels with the aforementioned purposes.

Never mind that there has been no public demand for this service. Present cellular services here in the US alread offer almost all of the services proposed by MURS, and what ISN'T covered by MURS is either accomodated by the General Mobile Radio Service (a UHF voice service at 462/467 MHz), FRS, ot the itinerant business channels.

This was nothing more than a ploy to sell more radios. The channels that MURS will occupy are inbetween former police channels (now on 800MHz). Unfortunately, the prospoсed service will ALSO be near channels STILL used by Public Service users in less affluent areas and other business and wireless users (ie: pagers)

Not all areas of the US find it necessary to move to UHF/Trunked systems. The area I live in is rural, and outr local PD and Sheriff are still on VHF and have no immediate plans to move. Why should they?

However the proliferation of these types of radios (MURS) and the almost certain "sprawl" it will create to adjacent channels will make it almost mandatory for such agencies to spends tens of thousands of dollars to change systems due to interference.

There is nothing new or innovative about the services MURS proposes to provide. It was simply an aggressive commercial market that managed to manipulate the NPRM process favorably and now we are going to have to do some quick tap dancing to stop it before it can manifest.

The intent is an interesting one, but other resources already exist that can better fill this need and withn only changes to existing regulations, not creation of new ones.

Yes you do. UI-View uses bitmap/raster maps, which don't zoom very well,
so UI-View won't do it. WinAPRS etc are usually used with vector maps,
which of course scale very well, but are typically not as nice to look at.

Hey Folks,

I am think of developing a system for radio telemetry of small animals -
turtles in this case - and was looking for suggestions. We have been
using small vhf transmitters that run off a couple of watch batteries.

These are commercially available and very expensive, not to mention bulky and short on range.

I would like to put together a small transmitter that will run for several months off a watch battery, preferably at 900mhz or 2.4 ghz. This will allow me to track the turtles with greater precision (because I can use a more directional antenna). These turtles hang out in swamps filled with poisonous snakes and alligators so being able to localize from a high spot several hundred meters away would also be a plus!

There seems to be a number of chips available these days - byproducts of the cell phone and portable home phone industries. I was wondering if anyone out there has played with any of them?

Thanks.

Hi Paul,

I prefer APRS+SA it uses the Delorme maps which I happen to like.
The author seems to keep up a bit better with changes in APRS than
the WinAPRS folks do. I have founsd the author quite responsive to
probelms and issues although he has a serious day job and only does
APRS+SA on the side.

Can you point me in the right direction on where to get it? I'm keeping all
options open right now, and would like the Best possible program. TIA

Does anyone have the Manual for the Kenwood TH-78A Handheld Transceiver For Adobe Acrobat?

They used to have it available to download on their website, but no longer carry older radio manuals.

Any help is appreciated.

Check out Creative Services Software at http://www.cssincorp.com/
They have a package for either TNC and if you only want VHF packet the
software demo is free. You can't do much better than that and the software
actually works and has excellent support from the company.

I am looking to trade my Alinco DJ1FT 2m Handheld with accessories for either a rigblaster or a built and working PSK transceiver that was in QST. I also believe that a company produced kits.

If interested, please email me at redberd95@aol.com.

Does anyone know the bit pattern sent during the transmitter's

TXDELAY? I believe this is referred to as "channel seizure" in the
AX.25 spec. It does not appear to be the frame byte 0x7e.

Ideally, it's a sequence of flags. What makes you think it isn't a flag sequence? What are you listening to? I suppose it doesn't actually matter all that much as long as a flag preceeds the actual frame (I might have heard a TNC out there that sends alternating raw 0/1 before NRZ-S decoding). Most TXDelay tones I've heard are flags.

I'm not sure what API(s) you're referring to here, but the OSS API hasn't changed significantly in a good long time. There is no difference between the OSS/Free and commercial OSS APIs.

ALSA does indeed have it's own API, but you don't get new functionality without a change in the semantics of the interface.

> A more stable and unified API would help the availability of (semi)
> commercial applications, but apparently that is not a priority for
> Linux developers. This sometimes is a shame.

Of course it is a priority for Linux developers, but with anarchic development you don't settle on an API until you know you have it right. Until it's "right" it's a free-for-all .. that's how you avoid costly longer-term mistakes.

I'm not sure what your argument is here. Are you somehow suggesting that the ALSA and OSS APIs should be the same? Or just that they should be ioctl() compatible for common functions? In time one of them will come out on top and will become the standard sound API.

> I'm happy to see OSS die out, unless 4Front-Tech stops

Why? Because noone is developing the drivers you want for OSS/Free?

I see little value in undermining OSS/Free. It is free software that anyone could add appropriate or additional drivers to should they so please.

I've no qualms with 4Front-Tech offering a commercial version .. I'll never use it .. but they're entitled to do as they please in that respect. I've also no qualms if they want to differentiate their commercial offering by time-lags in card support, again, that's entirely their prerogative. I'm guessing in some cases the lack of support for some soundcards in OSS/Free has more to do with NDA's imposed by the vendor than any commercial decision on the part of 4Front-Tech.

In case ya'll haven't heard, on July 12th
the FCC created the Multi-Use Radio Service.
It's for people who want to be on the radio
but don't want to have to learn all the rules and
stuff for the amateur service. The difference between
MURS and CB is that MURS will have repeaters, packet,
data, imaging and, like CB, won't have any regulations.
Oh, there is one regulation, you can only transmit up to 2
watts of power. (I got this info from QRZ.com, the like to
the article below).

The full article is here:

http://www.qrz.com/articles/00/10/15/1215251.shtml

My personal opinion (which probably doesn't mean much
to anyone but me), is that the FCC isn't going to stop at the MURS service.
They're just going to continue on, and eventually, the entire amateur

service
will be regulation free.

What's your opinion?

Anyway, the reason for this posting is because most people don't
know about the MURS service.

(I'm probably gonna get tons of spam from this, too.)

73,

Rally The Sheep

How on earth to you corrolate the MURS service with the reduction of
the amateur radio service?

Thanks Bob for the kind works..

FYI, you can sync Pacterm/Pkterm and MultiComm Host's windows with

Logwindows, DX4Win and soon Logic 5. This way, you can have your TNC in host mode, and use it not only for packet spots, but logging also.

***I read the article you listed, and cannot find any reference that
says the MURS will permit repeaters. And give me a break. 2 watts ERP
and 5 VHF frequencies. That's real competition to Amateur radio,
yea right. If you are going to send a message world-wide, please
do not paint an unrealistic "dooms-day" picture for the Amateur
community! And get your facts straight.

I would say avoid WINAPRS. I'm a registered user, and I quit using it about a year ago ($60 registration fee). Since then I am an avid UI-View32 fan (about $20 +/- the exchange rate). WINAPRS is a Win 3.1 program, and it is visually unappealing.

I use Street Atlas 7.0 and UI-View works two ways with that.

1) You pick an area, use map grabber (a button) and it makes it into a .BMP file with lat/lon of the top left and bottom right corners. Drink this into Paint Shop Pro and play with the colors and reduce colors/contrast and it's wonderful.

2) Instead of selecting a map, you select Street Atlas from the map selection menu. Presto, the Icons show up on a map sucked in from street atlas.

3) You can use any map you know where the top left/bottom right points are, or any two points on the map. I have a few aviation maps I like to view when I see air traffic (sectionals and lows).

This is just my opinion, but I've tried them all, and UI-View is the cream of the crop. Everything else is a poor substitute.

Here's Rogers signature block:

Roger Barker, G4IDE - roger@peaksys.co.uk
For UI-View go to - http://www.packetradio.org.uk
For WinPack go to - http://www.peaksys.co.uk

Right; my use of the term "ideally" indeed stems from the AX.25
spec's use of the term "should", but I am curious which implementation
seems to be doing something other.

FRS is pretty busy here in the Salt Lake City area. However, I don't see
MURS as a serious competitor to Amateur Radio.

The AX.25 specification says that interframe time "should"
be filled with flags. So it appears that an implementation which
uses bit patterns other than flags is allowed by the spec.

All the programs are on the TAPR web site http://www.tapr.org
none are free per agreements with Bob Bunninga owner of the
core APRS code. When you get to TAPR go to the APRS SIG
there is more there than you ever wanted to know.

I'm thinking I might like to experiment with packet radio.

I have an FM radio, a couple of computers (386 DOS laptop, Mac PPC, SunSPARC workstation), and so now I guess all I need is a TNC of sorts.

I've read much of primers and faqs at the tapr.org web site.

I wonder if anyone has any suggestions on particulars for the TNC.

I might like to try APRS, as I have a GPS recevier, as well. I also might like to take the show on the road, if I ever get a PalmPilot (thinking about it).

So, I kind-of thought the PicoPacket TNC from PacComm looked nice.

I also have an old 73 magazine article on building the poor man's packet for the Mac, but I can't find the FSK modem anymore. Any other TNC construction articles?

Thanks for any input / suggestions / etc.

73,

Don't bother, this program is awful. The interface is ridiculous, and it
dose not even work that well compared to Zakanaka, Winpsk, or Digipan.
All fo those are free.

Perhaps one of the software based decoders could report what it sees prior to the first flags, between flags during the interframe time, and after the closing flags. There is at least one implementation, as you mention, that does not "sound like flags". The TRS-80 S/W implemenation may have sent something other than flags during TXD ... and possibly the GLB controller did also. I remember some discussion of this issue about mid 1984. Wonder if the NJIT conference archives still exist somewhere, that's where the discussion took place.

Rally The Sheep,
Do you really see MURS as being threatening at all
to amateur radio? I don't. Seems more like the manufacturors
trying to revilalize their 'color dot frequency' radios.
I can see where there could be lots of interest in this.
As I read the proposal, it allows voice, and digital modes,
repeaters, and paging. By the way, it's 2 watts ERP, so
that opens up a bunch of antenna options. Interesting
options...

I am referring to the interfaces in the widest sense of the word, including
not only things like the sound, video, graphics, user-interfaces but also
system interfaces, C-libraries, file locations etc.

What I mean is the complete environment that an application is running in. This environment has been changing so often that many applications are not available for all possible environments, and thus are bound to certain revisions or distributions.

Sure it is nice if the best possible API is invented, but there is not much progress being specificially made in that direction.   Face it, Windows has many more usable APIs than Linux has. Of course this is because of the development method used for Linux, but this certainly is a disadvantage of that method. It would be better if APIs are designed "by mutual agreement" and then the implementations would compete for the best result.

It is in the "mainstream TNC firmware".
From the TAPR TNC2 firmware 1.1.7 release notes:

    Pre-frame sync of zeroes rather than flags for reduced
    TXDELAY (the other station can lock on to your transmissions
    faster).

    A "diddling" TXDELAY/TXDELAYC interval replaces the familiar
    "flagging" keyup time. Zeroes are sent for TXDELAY,
    followed by the number of flags specified in TXDELAYC.

Apparently they believe that the 1/0/1/0 sequence (= NRZI encoded 00 bytes) will lock the receiver quicker. Probably the receiver clock recovery PLL.

The disadvantage is that a noise spike may be detected as a FLAG, and then the remaining 00 fillers are received as databytes until the leading flag of the real packet arrives. This "phantom" packet is usually rejected due to bad CRC. But I have demonstrated that sending a very long sequence of bytes between flags will crash certain AX.25 implementations (by memory starvation), so using this method at high datarates and/or long txdelays may cause problems.
It also wastes processing power receiving and storing all these zeroes, while a FLAG sequence will normally be handled internal to the HDLC controller (without issueing interrupts).

When you are doing HDLC decoding in software anyway (Baycom, soundcard) and there is appropriate bounds-checking and buffer size limitation in the software, there will be no difference.

I'm just saying it's a mess. Yes, one will win in the future;
sooner rather than later, I hope.

>> I'm happy to see OSS die out, unless 4Front-Tech stops

I dislike OSS/Free and OSS/Linux because they have delayed the
development of a true free sound API, like ALSA. If it weren't
for OSS, I suspect a truely free project would have begun earlier.

None of them offer the same modes though. None of the three you name
do RTTY, AX.25, Pactor receive etc, which MixW does. So your
comparison is pointless.

Pactor receive is useful for PSK31 ops, so you can see which
Winlink user is QRMing you.

Just to add a little (as another very satisfied UI-View user). UI-View will
run "on top of" AGWPE -- so you can use a sound card as a substitute for a
TNC if you like.

I suggest UI-View instead. It's much easier to use, and cheaper.

I couldn't agree more. UI-View32 was the best 22 bux, Canadian, I've spent
in a long time.

I have a Radio Shack Pro 2050 Trunktracker and was trying to directly punch in the Talk group IDs with the frequencies I have.Could some explain to me in a email in the most simplest term how I can do this ? And also I have tried to searches for ID numbers and unable to understand why I am not hearing anything ,I have gone through all the different trunking levels,i.e., E2 800, E2 900, E2 Hi, E2 UHF, Ed,E1 and still I have not heard a thing . When go out of trunking mode I can hear all the activity going on. What am I doing wrong ? I am trying isolate some of the radio traffic that I do not want to hear like EMS ,but not the towing services that use the same frequencies. PLEASE HELP!!! Send all replies to me directly ,not through the newsgroup Thanks!!

Don't have that doc, is it available on the TAPR site?
Found 1.19 EPROM image, but did not find docs.
Will look a bit harder.

Poor Man's Packet and other Baycom-like devices are not
TNCs. They are modems, with the protocol processing done in
software. Modern implementations do all the processing in
software.

The TCM3105 modem chip these designs used is long obsolete
and unavailable in surplus. MX614 is a replacement, albeit
not a drop-in one.

I've been playing with some DSP stuff at home, and, for what
it's worth, every system I can hear from home sends flags
before it starts sending data.

I've seen satellite systems that use Manchester encoding to
address bit sync issues.

It might seriously cut into the No Code Tech future numbers. Lots of
them had no other goal in mind in ham radio than that sort of usage.

ftp://tapr.org/software_lib/tnc/tncnot.zip has the release notes for
1.1.0 through 1.1.7.

AFAIK the most recent image on the TAPR site is 1.1.8a. I don't think
Howie has given permission for TAPR to freely distribute 1.1.9, except

as an EPROM.

Bob

The soundcard modem implementation of HB9JNX did this (I don't know of
current versions though). Actually sending a 0-1 sequence is better for
clock recovery purposes...

Found a tncdocs.zip there, dated '92, for version 1.18a.
Thanks for the pointer.

Makes sense to send whatever bit pattern will provide
optimal clock synch during TXD time ...

The current version of MMTTY (v.1.59) has special provision for programmers.
You can link your programs to MMTTY or use the MMTTY RTTY engine as part of
your program.

You can only use MMTTY and the RTTY with programs that are distributed for
free.

Check the MMTTY English Website for information, source code and samples
----

MMTTY users and programmers,

I have received many emails about the logging and contest utilities of MMTTY. I am sorry, I will not be able to accommodate all the requests in my limited time for the MMTTY development.

For this reason, I added the TNC emulation mode, which makes the PC running MMTTY act as a TNC. You can control the PC as a TNC by connecting to another PC with a null modem cable. This emulation mode, however, requires two PCs or one PC with three COM ports; it is not a smart implementation.

I asked Bob Furzer, K4CY, for any good idea. He has quickly proposed a method using a simple inter-process communication (many thanks to Bob). This method makes it possible for MMTTY to easily communicate with other applications without using Windows registry. Based on his idea, I added a remote control mode to MMTTY. According to the discussion with Bob, I have incrementally added various functions to the mode. You can make full use of these functions.

Although I explain the usage of the functions in C, you can use other languages such as Visual Basic because the API should be the same.

apparently, when i posted this message, many thought that i
was saying that murs is a competitor with amateur radio.
that is NOT the impression i meant to send.
at this time, i do not think that murs is a serious threat to ham
radio. and rememeber, when i gave my personal opinion, that's
just what it was. my personal opinion. i'm not saying that's what's
going to happen, that's just what i THINK might happen eventually.

so go ahead call me a pessimist. it's my PERSONAL opinion, for
the amusment of me.

Hello all.

I have been running a high profile digipeater for APRS for quite some time now. I ran it in terminal mode, and simply copied my APRS "data string" to my beacon text and set it to an hour. This worked great, and everybody liked the station.

I use a Kantronics 9612, and have the UHF side set to our local packet 9.6k backbone (none APRS).

I decided to install APRS, and cant seem to get the "data string" to tx on port one (VHF) only. I need to completely seperate the two ports...is this possible with APRS ver 2.4.6?

TIA

It is legal to provide a service to other hams, provided that you do not
charge for the service, and that the messages contained comply with the
FCC's rules. You (as sysop) are responsible to ensure conformity to FCC
regulations. Private, personal E-mail is fine. But don't start sending
advertizing, or soliciting for business transactions.

> > As long as you aren't conducting business over the Amateur

>
> Exactly.
>

This is true, and as a system operator, it is up to YOU to make sure it
stays that way. Do you want to be responsible for filtering out all of
the internet flotsam that may flow through your station? E-mail is one
thing, but you open up a can of worms (and possible trouble with the
FCC)if you start granting full internet access.

Dave

CQ Advice, CQ Advice DE AC7JO,

I am looking into packet but I don't know where to start. Could you point me to some web sites where I could start learning about how to get my feet wet? The TAPR web site is confusing and I have already read the ARRL TIS info on digital. Specifically, I am interested in TNCs and old PCs (I am Mac-only at present,) their prices, and availability's.

My eventual goal is to communicate with the International Space Station,
and with my father, KD7GNO, when I go off to college. I own an IC-2100,
and have been loaned an HF rig by WA9OXY. Also, I am a student whose
parents have just bought a house, so I don't have much cash left. So,
any advice? Thank you in advance for your time.

73

Since the original post I've installed WinWarbler. This program runs fine.

There are a couple of problems here:

The concept of a "sound device programming API" is more a loose concept than a standard in the Microsoft world, as are most of the "APIs". In the Linux world the APIs are more strictly defined and adhered to.

Releasing source for Microsoft apps might help a bit, but will have nowhere near the impact of releasing source for Linux apps.

In the Linux world all the development tools are freely available and are provided with Linux. For Windows, you have to buy the development tools, often at hefty prices.

Since the authors of PSK programs are writting as a labor of love and not making a dime off their efforts, I can find no fault with them for not having a lab full of systems with every sound card on the market checking for compatibility with all of them.

On the original subject of what to do when things don't work, I would suggest the following:

First make sure the sound card works with Windows; i.e. can you hear the normal Windows sound effects?

Leave your speaker connected to the sound card and connect your receiver audio to the sound card. Can you hear the receiver audio through the sound card? You will probably have to play with the mixer settings to hear it. If you can't get audio out of the speaker, it is probably your wiring. If you can get audio but no waterfall, it is probably your PSK program; try another one.

Once you get receive to work, try transmitting with the speaker still attached to the sound card. You should hear the transmit audio.

If you are using serial port PTT, connect it up, turn the carrier and audio all the way down so you won't produce RF, and try transmitting. This should key the transmitter and verify the serial port is correctly configured and wired.

Remove the speaker, connect up the transmitter audio and try to transmit. If you can't get modulation, it is probably your wiring.

Hoffa misspoke - we have a National DEBT of 5 Trillion - and have
crushing interest payments.   This year, we are running a small budget
surplus - but our politicians are trying to figure out ways to spend it.

The discussion is about PDAs Hank. Nobody is avoiding anything. The
common carriers do not provide equivalent services. There are MANY
cases where you can't use a common carrier, but could use your own
service in a PDA mobile application. I'm not about to carry around
BOTH, because I "might" be able to use the common carrier service
sometimes - that is silly.

The fact is - the big carriers are not going after this market because they know it isn't worth investing R&D dollars on a service that it will be archaic in a few years when TV Channel 60-60 are converted to high-speed mobile digital access services.

There IS a small window of opportunity here. But guys like you are too busy trying to treat digital data with kid gloves and "control freak" ideas. Just treat digital data the same way you would treat voice data. It is NO different. It is simply information.

Well the old Kantronics KPC-3's work fine but the new pluses are a bit better. For packet any old 486 or low grade pentium will work just fine for packet. You should be able to find used KPC-3's for a song, old PCs as well. I use KAGold for packet, see:

http://www.interflex.com/

For more packet info check out:

http://www.ac6v.com/pagew.html#PACK

73!

Heavens, if all you need is a terminal for a KPC-3, even an old 386 box is likely
to do the trick. Older machines are suitable, too, but the software support is
likely
to be poor.

I beg to differ. My experience (as a developer of some Windows music
software) is that the sound API is quite stable and reliable on
Windows. My guess would be that any problems with particular sound
cards and particular programs are caused by bugs in the sound
card drivers, which are not rare enough.

Also, in my quite limited experience, Linux sound APIs are not
nearly so well defined. For one thing, there's too; the old
commercial OSS (Open [sic] Sound System), and ALSA (Advanced
Linux Sound Architecture, if I recall correctly).

ALSA is new and free. The linux kernel includes OSS/Free,
which is a cut down version of OSS/Linux, the commercial
product. The commercial product has lots more drivers.
Fine for 4Front-Tech (the authors) to make a few bucks,
but not in Linux's long term interests.

Well, that's better than here in Australia, where we have a large
surplus and our government refuses to spend it, despite the fact
that our petrol prices are out of control and most of that goes
in federal government taxes.

Wow, logged with point of origin! That will *scare* your abusers!
And what are you going to do when it turns out to be a dialup on uunet or
one of the other providers not interested in taking an abuse report??
Each time he dials in he will have another address, so there is little else
you can do than blocking the entire networks of those companies...

It is the same here...  the surplus is used to pay back the national debt,
and the tax on petrol is built up in a very creative way: when the oil
prices drop, the government complains how the tax income drops because the
tax is a percentage, and they add a "temporary" fixed tax amount.
When the oil prices rise, they have completely forgotten about the
"temporary" fixed amount and let the percentage part do the job.  We
already know what is going to happen when prices drop again...

And even with multiple different architectures, the writers of DSP
applications complain about lack of features and access the soundcard
directly, not via the drivers.  So a card that works fine for generic Linux
```

sound may still fail when used for DSP modems.

I agree that in Windows the situation is better than in Linux.

An 8088 or a C-64 will work too, Gosh, even a "terminal" like the ADM-3 should still be available at swap meets.

I'm kidding. A 486 is probably all you will find anymore that still works, and has the speed and memory to run windows 95/98, and the BIOS can handle modern interface cards without randomly locking up or getting a blue screen of death (BSOD).

There was nothing wrong with the advice, and I don't know why you feel the need to describe it as overkill, other than just to show us your greater knowledge on the subject, and how stupid everyone else is.

I find it amazingly ironic that you write the above paragraph and
then go on to write:

> There was nothing wrong with the advice, and I don't know why
> you feel the need to describe it as overkill, other than just to
> show us your greater knowledge on the subject, and how stupid
> everyone else is.

... this one.

Perhaps I should explain it simply to you, Steve, in short words ;-) This person
is looking for a terminal for a KPC-3. They're not likely to need to run Win9X
or plug in "modern interface cards".

From what I read, all they need is a machine that does a compentent job of
running a terminal emulator via a serial port. Like you, I point out that
older machines (I say pre-386) are not likely to have good software support
anymore.

Exactly how does this bit of advice on my part display arrogance?

The above isn't a proper response. Please quote the wording that says you can't provide e-mail on ham radio packet because e-mail is available from commercial providers.

Exactly.

Dave Hall further wrote:

Well at 1200 baud i wasn't about to "open up full access," just e-mail. I had about four users, and in a little over a year, no junk e-mail had started coming thru. If it had started to do so, i had a policy (and mechanism) to control that. I'm not going to go into the details of the policy i had because i don't have to defend it here ... suffice it to say i was satisfied that i was doing what i needed to do to protect my license. The ares/races and HF-god people in my area wouldn't touch my system (good riddance) but one of the younger god-approved sysops did put a notice to HIS users that i was on frequency and he put a node connection available to his users in order for them to get to me. I moved away from that area (1998), else i'd still be doing it.

The scores of people i was in touch with (via an e-mail list) who were/are doing the same thing i was, reported that they'd never yet had problems that could get them canned.

The hams in the San Francisco bay area who had 100K+ capability told me that THEIR problem was that no one was interested in playing with them ... the equipment starts getting pricey. So, ham radio dies for lack of interest...

9600 baud true FM radio

Remember that the faster the packet with less retries increases
bandwidth potential with less packet clashing. So most true FM rigs ie;
allmodes,does not cut it unless the linearity of receiver IF having a min of
11khz this is needed for efficient RX of 9600 baud packets TXD needs to be
shorter as well like about 70ms or so. Just a thought remember its FSK not AFSK!

Yes the Tekk Radios and modified Motorola Mitreks and Micors seem to
work very well on our 9.6kbs LANS in Chicago land area.

Rob, DHCP translation logging still gives point of origin! Dynamic ip's are masked to the server Ip. Its just a way to filter those who are abusive is all. The other server users may loose out oh well! Such is life on the gateways eh? Remember there is always reverse hop check translation.

There are certainly many ways to filter ampr only logins, permission restrictions ect. Its just a start and fair way warning to all. We all have to start somewhere ya know.   Thanks for the input.

DHCP translation logging? Please explain?

DHCP is *not* involved in the typical PPP dialup (with dynamic IP).

How are you doing the masking? It is difficult/impossible to know how far a subnet extends knowing only the IP address.

reverse hop check translation? You mean traceroute? Used to work fine, but is crumbling because of the filtering that many ISPs are installing, and the lack of reverse DNS entries (partly because of the way IP addresses are assigned now) isn't helping either.

Rob

I have used an old PC clone of the origional msdos pc. An 8088 computer with 640 K of memory and a 10 meg hard drive. Anything that you can run a simple terminal program on will work. Might not do much of the fancey stuff, but will work fine for the text.

I would have thought by now the packet stuff would have gone by the wayside. Unless chasing DX and using the DX cluster I jsut can't see very much use for it now with all the other modes out. Seems too slow to me. A few years back a friend and I were talking on 2 meter ssb about 150 miles apart. Decided to see how we could work packet via the digipeaters. Seemed to take about 5 minutes or more to get the messages one way. Probably not too bad, but not very good for real time communications.

Does anyone know of a site to download software to use a Pentium and sound card as a packet TNC.

I would like to try HF Packet and I am already setup for PSK31 with cables and PTT.

Thanks,

N3OJV, AL

Vista Print is offering 250 free business cards that make great 'eyeball' QSL's cards.

These cards are in full color, and look great.

You design the cards with software that runs in your browser.

Then pay a small shipping fee for them. (currently less than $5 in the US)
You can also order more than 250 at a discounted price.

The link is:
http://service.bfast.com/bfast/click?bfmid=26298982&siteid=34622821&bfpage=88by31links

(disclaimer: I don't work for VistaPrint, but I am one of their customers, and affiliets. If you don't approve of me making fellow hams aware of this offer, while getting affiliet points, please feel free to go direct to vistaprint.com without using my link. They will still give you the 250 free cards.   [enjoy])

Many prohibitions, here is one:

S 97.113 Prohibited transmissions.

(a) No amateur station shall transmit:

(5) Communications, on a regular basis, which could reasonably be furnished alternatively through other radio services.

You are dead meat.
The above is a good advertisment to draw crackers.
Simple source ip hack, and I come from any ip I want you to see.
Plenty of open relays around, I could use one of them. They keep no logs..

But this whole topic has nothing at all to do with ham radio.

Refering to the rule about prohibition on radio services REASONABLY
provided elsewhere and combined with thinking about "cellular" now
doing Internet connetivity so hams can't; I submit the following.

Whew! Since "cell" phones don't provide any service at a reasonable
price; the point is mute. :)

One could debate the definition of "regular basis". But the rule is there just the same. I find that gating E-mail from the internet to a packet radio mail address, is perfectly fine. Where people like Stew cross the line, is when they start talking about apps that access the weather, stock quotes, horoscopes, games, and other activities that are clearly not within the purpose of ham radio. Such activities ARE available through normal commercial providers, and since these are commercial venture, they may be in violation of the "no business" rules as well.

These rules were deliberately and thoughtfully created to prevent people from duplicating the communications efforts of the telco industry, on a large scale. If these rules were not in place, hams could theoretically create a network that provided a service to the populous at large, while bypassing many of the legal, and regulatory issues that commercial providers must deal with, thereby giving the "amateurs" an unfair competative advantage.

Yes, it's about money (isn't always?). The powerful lobbies of the telco industry were effective at setting these rules in place.

If the purpose of your station is to make it look like some other licensed service, then the thinking is, that you are not in the hobby for the right reasons.

The purpose of ham radio is purely hobby, with operators discussing things that have to do with radio, or experimenting with radio modes.

Once that mode is established as an accepted part of the hobby, it cannot be used to provide any services that you would otherwise be expected to pay for, or subscribe to.

There is the disaster services aspect, but this has been pretty much overshadowed by FEMA, and is mostly redundant.

The best band to use today, for non-hobby communications, is Part-15 allocations (this includes many ham frequencies, as Part 15 covers almost all of DC to Light. The best bands though, are the ones that authorize Spread Spectrum, and these allow power levels and antennas that are useful.

I have discovered AE4JY's PSKCORE.DLL that allows you to implement PSK31 support in your own 32-bit Windows program. I will be developing some custom radio control software for my new TenTec Pegasus transceiver and plan on using PSKCORE.DLL to provide support for PSK31. I am looking for similar tools for other modes using the soundcard, such as RTTY, AMTOR, CW (receive), SSTV or any other modes (THROB, Piccolo ?). The software I am writing will be in Borland Delphi and run on Windows 95/98/NT. I should be able to work with a DLL written in other languages as well.

I have recently put a HAL DXP38 on the air on RTTY with some success. Can anyone recommend a GOOD book about all digital modes, including RTTY?
How does one recognise CLOVER tones, ASCII tones, etc. I'd appreciate any suggestions.
73, Steve AA4V

Well, thanks for the quote. In spite of this, the FCC
hasn�t moved to shut down all those scores (hundreds?)
of jnos-tnos-xnos stations. I will operate if i choose
to, given that apparently the FCC isn�t interpreting its
rules in the same way you seem to. Also, I doubt that
any of my users 1997-98 had other RADIO access to
internet e-mail.

Apparently the situation in the USA is the same as over here: content restriction violations on amateur band (and other similar violations that do not put other users of the radio spectrum in danger) are extremely low priority. This is equal to "never get handled unless asked for by some official in the amateur radio society".

Ask some ARRL official to call them and they are shut down the next day.

Rob

IMHO....

I tired of hearing that Ham radio is just a hobby. Of course it's a
hobby
but that's not all. I'm not talking about emergency services either.
That's
all well and good and may be one of the reasons our bands still exist
but

I'm sick of the politics.

If all we're doing or allowed to do is help each other set up stuff and enjoy the fun of getting it working; what then? Are we to do nothing but test our SWR and call it a hobby. If you keep saying what Ham radio is NOT then you're cutting it off at the feet. Why the hell would anyone want to be a "Ham" once the "fun" of setup is over? It limits the hobby to smart asses.

The point is, WHERE'S THE BENEFIT? We need to be flexible about Internet connectivity and new methods. Everyone is quick to say that packet has been hit hard by the internet. Yet not enough say what CAN packet do that's different. Plus, stop the either or one sided thinking! For example, use the darn Internet when it makes since. If you want to brag about not using anything but radio, fine. Yet keep your mouth shut when others do their thing. Too many "rule police" are self righteously killing Ham radio!

Sure I know, we need rules else it would be like CB. I understand that. But that's not even the issue. We're not talking about childish repeater abuse here. We're talking innovation. That is going to mean change. Too many of us simply fear change. Stop it!

If everyone listened to the nit-picking rule police then NO ONE would join the hobby/service. To the nay-sayers, I don't recommend breaking the law. My disagreement is the suggestion that *YOUR* view of Ham radio should be my view. Isn't it (after all) what we make of it? So first check you pride and arrogance at the door and remember we're talking about sharing the bands here and not murder. Don't be naive about the money involved and special interests too.

It's been said that the telephone lobbies promoted much of part 97 to keep everyone from using Ham radio instead of the phone system. While it's widely debated what the purpose and *true* intent of Part 97 is; we need to keep an open mind. We need to consider change. We need to know our vote counts *and* we can change the rules as new innovation necessitates.

So I hope you all get the point. There needs to be an attraction to ham radio other than just being technical. It's fun but why are we spending good money on equipment? Why are we training our selves in proper techniques? Why are we focusing on features and not benefits? Why is every real benefit seemingly shot down by outdated rules while ham radio dies off with it's old guard? CHANGE people, is a good thing. I suggest you get used to it. You haven't a choice in this regard. The goal is communication.

So I'd like to think Ham radio is about scientific exploration. New benefits from the new features, methods, and technology. I'd always considered Ham Radio to be the place for "do it yourself" radio innovation. It's a free county is it not. I hate politics but do you see there's money interests involved? So I say create first and then change the rules to back up your new benefit, if needed. Sure move to MURS or Part 15 or whatever if you need to. Yet, What's happening to Amateur Radio?

A pet peeve of mine is the "Amateur" in Amateur Radio. Just a thought. Why not call it Scientific Radio instead? Are we not promoting professional operator techniques? Professional doesn't mean money per say. It means professional. It means practiced. It means wise and it means benefits with communications. Is there a problem with calling it Scientific Radio? I guess we'll always be Hams. That is, if we still have a band to use.

It would be nice if "Hams" were thought of as being smart and not smart asses. Watch out that you're not a smart *ass*. Sure be technical but get real. We need to respect all operators regardless of technical knowledge. Many spouses both technical and not so technical have joined in and all to our benefit. Plus, few debate the need to attract a young person (or old) who is just learning.

Further, why not even be known for caring first. Care about people. Isn't that the reason for communication in the first place? Let's add to our ability to care for people, like when we connect them to their loved ones in an emergency. Let's be known for our scientific innovation AND how it benefits all. Let's even be known for pointing out where big business seeks to control the airwaves and our pocket books. Why not make free wireless communications available to the masses. Why not? Who say's we must pay a toll? It's completely up to you.

Further I'll even say we need privacy and that includes encryption. Now I realize this is very controversial. I will tell you why. We need innovation in our thinking here. The standard government rant goes like this...we can't give encryption to the public, they say. Then some evil interest would communicate about destroying us and we wouldn't be able to listen in. Therefore (they say) our freedom is in jeopardy. They say it's a national security issue. So they control our privacy for the sake of security. This is in fact, our current situation if you didn't know it. We have no communications privacy.

So what's the problem with that? After all, what do you have to hide, right? WRONG! Have you not heard about the epidemic of identity theft for one example? Do you believe everyone and anyone has a right to know anything and everything about you? I think that's God's job. It is not the governments.

We are allowing the government to trade our privacy for security. Well isn't privacy a freedom we have fought and our forefathers have died for all these years. Isn't that like giving up the war to all comers, anyway? I believe it was Ben Franklin who said "If you give up your privacy for security, you will have NEITHER!". The problem is the men in government seek to *CONTROL* those not in government unfairly. Why is it OK for our government to have privacy and not it's people? If you see the government as your savior, I suggest what you don't know *can* hurt you. This has never been as important as it is today. Many are now realizing all too late, their privacy matters. Don't be too late, it matters.

So if you're one of the few who truly promote innovation and you are kind enough to do it with Amateur Radio, please don't give up. Focus on real communication benefits for people. Embrace change and do something about it.

You can do the same thing with Microsoft Publisher and print them yourself for free. Probably any publisher program will do this for you. Why pay someone else to do this if you don't have to.

Because the $5 you pay for the shipping is probably cheaper than
business card forms for your inkjet printer and looks better.

Further, why not even be known for caring first. Care about people.
Isn't that the reason for communication in the first place? Let's add
to our
ability to care for people, like when we connect them to their loved
ones in
an emergency. Let's be known for our scientific innovation AND how it
benefits all. Let's even be known for pointing out where big business
seeks
to control the airwaves and our pocket books. Why not make free wireless
communications available to the masses. Why not? Who say's we must pay
a toll? It's completely up to you.

Further I'll even say we need privacy and that includes encryption. Now
```

I realize this is very controversial. I will tell you why. We need innovation in our thinking here. The standard government rant goes like this...we can't give encryption to the public, they say. Then some evil interest would communicate about destroying us and we wouldn't be able to listen in. Therefore (they say) our freedom is in jeopardy. They say it's a national security issue. So they control our privacy for the sake of security. This is in fact, our current situation if you didn't know it. We have no communications privacy.

So what's the problem with that? After all, what do you have to hide, right? WRONG! Have you not heard about the epidemic of identity theft for one example? Do you believe everyone and anyone has a right to know anything and everything about you? I think that's God's job. It is not the governments.

We are allowing the government to trade our privacy for security. Well isn't privacy a freedom we have fought and our forefathers have died for all these years. Isn't that like giving up the war to all comers, anyway? I believe it was Ben Franklin who said "If you give up your privacy for security, you will have NEITHER!". The problem is the men in government seek to *CONTROL* those not in government unfairly. Why is it OK for our government to have privacy and not it's people? If you see the government as your savior, I suggest what you don't know *can* hurt you. This has never been as important as it is today. Many are now realizing all too late, their privacy matters. Don't be too late, it matters.

So if you're one of the few who truly promote innovation and you are kind enough to do it with Amateur Radio, please don't give up. Focus on real communication benefits for people. Embrace change and do something about it.

This one has a bit of Dos and Windows stuff.

http://www.muenster.de/~welp/sb.htm

I've never been able to find 300bd stuff for sound cards.

Well, I heard that Tom Sailer is working on a new version of
the soundmodem that runs in userspace and uses the normal OSS
sound drivers. The NEWQPSK implementation for Linux already does
this, as does the latest hfmodem stuff.

Ah... I may have another look at it. Fortunately I am now running OSS, as my new soundcard is not supported by ALSA. But my old soundcard was, and worked terribly in OSS. So then I used ALSA.

In general, the whole issue around APIs is widely underestimated by the Linux development community. New APIs for existing services are invented at will, whole C libraries are changed for mostly political reasons, etc. This confuses the users who are accustomed to a platform where most existing applications do not break when a hardware interface card is replaced, or an upgrade of the system is installed.

A more stable and unified API would help the availability of (semi) commercial applications, but apparently that is not a priority for Linux developers. This sometimes is a shame.

There are (at least) two APRS networks here in Oregon.

Check 144.390 and 145.750, you will find a lot of activity,
and plenty of folks to contact for ideas for your project.

=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0=A0GENET=
IC
FACTOR EYED

=A0=A0=A0=A0Biofeedback Systems in Los Angeles, is looking for volunteers with a rare genetic inheritance, to participate in a proprietary study.

=A0=A0=A0=A0At present, it is believed that fewer than one person in 400 carries a rare genetic makeup that predisposes them to having better health than most, a strong immune system, and an unusually high energy level. Aside from behavioral manifestations such as a generally positive outlook on life, the principal evidence that this genetic factor is present, is mirrored in the shape of the eyes.

=A0=A0=A0=A0It should come as no surprise then, that the eyes themselves would be used to select the people who are nost likely to have this elusive gene. Individuals selected for this study will be white, Caucasian, of either gender, and between the ages of 25 and 50. Compensation will be determined by a collective evaluation of the total number of applicants selected. Drugs will not be administered as a part of the study.

=A0=A0=A0=A0The eye contour that embodies the required genetic trait, has been roughly described as "almond shaped," but this is not an adequate definition. Exact specifications follow.

=A0=A0=A0=A0Looking in the mirror with the head level, the qualified applicant will see that the lower half of their eyelid is CONVEX UPWARD, from the bottom on either corner. The bottom part of the iris will be partially covered by the lower eyelid (this is important), and there will be a reasonable symmetry between the eyes on the left and right side of the face.

=A0=A0=A0=A0Applicants must submit a close-up facial photograph for evaluation. Since no risk or disease factors have been associated with this gene, any risk to volunteers in the study is contraindicated. Interestingly, it is apparent that the "energy gene" as it has been called, may be dormant in one or both parents, yet it may be actively transmitted to their children; but it is only infrequently active among two or more siblings.

=A0=A0=A0=A0If you know of a person, or happen to notice one whose eyes might qualify them for this study (preferrably among those employed in the technical community), you may want to share this data with them. Since so few people are fortunate enough to carry this gene, your only encounter with one of them may be in a fleeting moment. It would be wonderful if you had a copy of this announcement with you, and could share it with a prospect in passing. Alternatively, you could specify this website and posting date, or perhaps my email address.

=A0=A0=A0=A0They may then contact Mr. Norman Swartz at this [virus-proof] email address: analog24@webtv.net (It is not generally realized that, because webtv has no hard drive, it is immune to destructive computer viruses.) Or, they may write to: Biofeedback Systems, Post Office Box 8501, La Crescenta, CA 91214. No telephone calls please. Depending upon the number of volunteers selected, applications will be accepted through the end of December 2000, with a possible extension through 31 January 2001. The duration of the study will be a minimum of two years.

I have a GE Mastr III UHF repeater that came with a super neat looking radio modem made by Electrocomm Automation that is rack mount and consists of two seperate plug in cards into a 2 inch high 19 inch rackmount housing. The two cards are a RIM (radio interface module , for converting station alarms to modem inputs and a Protocol converter, to convert radio data in the EA proprietary 9600 baud format to a RS-232 serial data link over a 14.4 lease line modem on the shelf above. If anyone has experence in making firmware or knows a source for same I would greatly appreciate it. I hate the idea that it is a garbage can liner device and would like to put it to good use..Jeff

Well, thanks for including the whole series of double-spaced advertising material, to all of us all over again, and trashing the newsgroup with your for sale shit.

I hope your fucking education at OSU improves to the point just
past the slobbering idiot you seem to be now!

Here, let me send your God damned message again, in case some
other fucking idiot didn't get it either.

Someone do a Palestinian dance on this fucking bastard N8WCT.

If you are going off to college, think about building or buying a reasonably up to date PC that you can network into the dorm internet system. During the course of your studies you are likely to encounter situations where you will be given documents in Word or Excel and you'll be expected to open or submit in the current version formats. You can build a very good computer these days for relatively little cash. Older 486 machines just don't have the muscle to handle Windows ME or 2000. I'm an old Mac guy too but use both becasue of what the software demands. In a college environment you will discover that most schools are set up to troubleshoot PC's though.

I have Digipan 1.2 up and running good but have one problem that I can't
seem to fix. The outgoing transmitted text does not echo to the received
text window. Would appreciate any help.

I don't know about Colleges, but many Universities will now tell you which
computer to show up with.  For example, many engineering schools specify
a laptop and a wireless pcmcia.  One guy at work put together a machine
for someone's daughter, who was going to a University.  They told her it
wasn't good enough to hook to the network, or complete her assignments.
Father was a little pissed, but bought the specified Dell...

Best answer:  Buy what the school recommends.

If that would happen here, all other manufacturers and distributors would
climb into the highest trees to shout about the unfair competition...

Making Money Faster than you ever have before.... And do it while your =
sleeping

READING THIS COULD CHANGE YOUR LIFE! I found this on a bulletin board =
and
decided to try it. A little while back, I was browsing through =
newsgroups
I came across an article similar to this that said you could make =
thousands of dollars within
weeks with only an initial investment of $6.00! So I thought, "Yeah =
right, this must be a scam", but
like most of us, I was curious, so I kept reading. Anyway, it said that =
you send $1.00 or $2.00 for Canadian=20
citizens to each of the 6 names and address stated in the article. You =
then place your own name and address=20
in the bottom of the list at #6, and post the article in at least 200 =
newsgroups. (There are thousands) No
catch, that was it. So after thinking it over, and talking to a few =
people first, I thought about trying
it. I figured: "what have I got to lose except 6 stamps and $6.00, =
right?" Then I invested the
measly $6.00. Well GUESS WHAT!! Within 7 days, I started getting money =
in the mail! I was
shocked! I figured it would end soon, but the money just kept coming in. =
In my first week, I made
about $25.00. By the end of the second week I had made a total of over =
$1,000.00! In the third
week I had over $10,000.00 and it's still growing. This is now my fourth =
week and I have made a
total of just over $42,000.00 and it's still coming in rapidly. It's =
certainly worth $6.00, and 6
stamps, I have spent more than that on the lottery!! Let me tell you how =
this works and most
importantly, why it works. Also, make sure you print a copy of this =
article NOW, so you can get
the information off of it as you need it. I promise you that if you =
follow the directions exactly, that
you will start making more money than you thought possible by doing =
something so easy!
Suggestion: Read this entire message carefully! (print it out or =
download it.) Follow the simple
directions and watch the money come in! It's easy. It's legal. And, your =
investment is only $6.00
(Plus postage) IMPORTANT: This is not a rip-off; it is not indecent; it =
is not illegal; and it is
virtually no risk - it really works!!!! If all of the following =
instructions are adhered to, you will
receive extraordinary dividends. PLEASE NOTE: Please follow these =
```

directions EXACTLY, and
$50,000 or more can be yours in 20 to 60 days. This program remains =
successful because of the
honesty and integrity of the participants. Please continue its success =
by carefully adhering to the
instructions. You will now become part of the Mail Order business. In =
this business your product
is not solid and tangible, it's a service. You are in the business of =
developing Mailing Lists. Many
large corporations are happy to pay big bucks for quality lists. =
However, the money made from
the mailing lists is secondary to the income which is made from people =
like you and me asking to
be included in that list. Here are the 4 easy steps to success: STEP 1: =
Get 6 separate pieces of
paper and write the following on each piece of paper "PLEASE PUT ME ON =
YOUR MAILING
LIST."Now get 6 US $1.00 bills or a Twoonie and place ONE inside EACH of =
the 6 pieces of paper so
the bill will not be seen through the envelope (to prevent thievery). =
Next, place one paper in each of
the 6 envelopes and seal them. You should now have 6 sealed envelopes, =
each with a piece of
paper stating the above phrase, your name and address, and a $1.00 bill =
or Twoonie . What you are doing is
creating a service. THIS IS ABSOLUTELY LEGAL! You are requesting a =
legitimate service and
you are paying for it! Like most of us I was a little skeptical and a =
little worried about the legal
aspects of it all. So I checked it out with the U.S. Post Office =
(1-800-725-2161) and they
confirmed that it is indeed legal! Mail the 6 envelopes to the following =
addresses:

#1)Sherry Beth 345 Pacific Ave. N. #DD7 Pacific, WA 98047 :=20
#2)Joseph Erickson 16050 Hare Creek road - Corry, PA 16407 :=20
#3)Fabien Thillet 1836 Beach Drive, Box 36 Gulfport 39507, MS
#4)R. Blair 418 10th Ave NW Calgary, Alberta, Canada t2m0b5
#5)R. Bates 620 Crescent R.D N.W Calgary, Alberta, Canada T2M-4A6 <----- =
Very popular list
#6)Franck-Alix Julien 1090 kristin way Apt. 811, Ottawa, Ontario, Canada =
K1K4B6 <----- Very popular list
if more money is sent time on the list is then increased

: STEP 2: Now take the #1 name off the list that you see above, move the =
other names up (6
becomes 5, 5 becomes 4, etc...) and add YOUR Name as number 6 on the =
list. STEP 3: Change
anything you need to, but try to keep this article as close to original =
as possible. Now, post your
amended article to at least 200 newsgroups. (I think there are close to =
24,000 groups) All you
need is 200, but remember, the more you post, the more money you make! =

This is perfectly legal!
If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal =
lottery laws. Keep a
copy of these steps for yourself and, whenever you need money, you can =
use it again, and again.
PLEASE REMEMBER that this program remains successful because of the =
honesty and integrity
of the participants and by their carefully adhering to the directions. =
Look at it this way. If you are
of integrity, the program will continue and the money that so many =
others have received will come
your way. NOTE: You may want to retain every name and address sent to =
you, either on a
computer or hard copy and keep the notes people send you. This VERIFIES =
that you are truly
providing a service. (Also, it might be a good idea to wrap the $1 bill =
or a Twoonie for Canadian citizens
in dark paper to reduce therisk of mail theft.) So, as each post is =
downloaded and the directions=20
carefully followed, sixmembers will be reimbursed for their =
participation as a List Developer with one dollar each.=20
Your name will move up the list geometrically so that when your name =
reaches the #1 position you will
be receiving thousands of dollars in CASH!!! What an opportunity for =
only $6.00 ($1.00 for each
of the first six people listed above) Send it now, add your own name to =
the list and you're in
business! DIRECTIONS FOR HOW TO POST TO NEWSGROUPS------------ STEP 1)
You do not need to re-type this entire letter to do your own posting. =
Simply put your cursor at the
beginning of this letter and drag your cursor to the bottom of this =
document, and select 'copy' from
the edit menu. This will copy the entire letter into the computer's =
memory. STEP 2) Open a blank
'notepad' file and place your cursor at the top of the blank page. From =
the 'edit' menu select
'paste'. This will paste a copy of the letter into notepad so that you =
can add your name to the list.
STEP 3) Save your new notepad file as a text file. If you want to do =
your postings in different
settings, you'll always have this file to go back to. STEP 4) Use =
Netscape or Internet explorer and
try searching for various newsgroups (on-line forums, message boards, =
chat sites, discussions.)
STEP 5) Visit these message boards and post this article as a new =
message by highlighting the text
of this letter and selecting paste from the edit menu. Fill in the =
Subject, this will be the header that
everyone sees as they scroll through the list of postings in a =
particular group, click the post
message button. You're done with your first one! =
Congratulations...THAT'S IT! All you have to
do is jump to different newsgroups and post away, after you get the hang =

of it, it will take about
30 seconds for each newsgroup! **REMEMBER, THE MORE NEWSGROUPS YOU POST
IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM
OF 200** That's it! You will begin receiving money from around the world =
within days! You may
eventually want to rent a P.O.Box due to the large amount of mail you =
will receive. If you wish to
stay anonymous, you can invent a name to use, as long as the postman =
will deliver it. **JUST
MAKE SURE ALL THE ADDRESSES ARE CORRECT.** Now the WHY part: Out of 200
postings, say I receive only 5 replies (a very low example). So then I =
made $5.00 with my name at
#6 on the letter. Now, each of the 5 persons who just sent me $1.00 make =
the MINIMUM 200
postings, each with my name at #5 and only 5 persons respond to each of =
the original 5, that is
another $25.00 for me, now those 25 each make 200 MINIMUM posts with my =
name at #4 and
only 5 replies each, I will bring in an additional $125.00! Now, those =
125 persons turn around
and post the MINIMUM 200 with my name at #3 and only receive 5 replies =
each, I will make an
additional $626.00! OK, now here is the fun part, each of those 625 =
persons post a MINIMUM
200 letters with my name at #2 and they each only receive 5 replies, =
that just made me
$3,125.00!!! Those 3,125 persons will all deliver this message to 200 =
newsgroups with my name
at #1 and if still 5 persons per 200 newsgroups react I will receive =
$15,625,00! With an original
investment of only $6.00! AMAZING! When your name is no longer on the =
list, you just take the
latest posting in the newsgroups, and send out another $6.00 to names on =
the list, putting your
name at number 6 again. And start posting again. The thing to remember =
is: do you realize that
thousands of people all over the world are joining the internet and =
reading these articles
everyday?, JUST LIKE YOU are now!! So, can you afford $6.00 and see if =
it really works?? I
think so... People have said, "what if the plan is played out and no one =
sends you the money? So
what! What are the chances of that happening when there are tons of new =
honest users and new
honest people who are joining the internet and newsgroups everyday and =
are willing to give it a
try? Estimates are at 20,000 to 50,000 new users, every day, with =
thousands of those joining the
actual internet. Remember, play FAIRLY and HONESTLY and this will really =
works !!

<BODY bgColor=3D#ffffff>
<DIV><FONT face=3DArial size=3D2>Making Money Faster than you ever have =
before....=20
And do it while your sleeping</FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2><BR>READING THIS COULD CHANGE YOUR =
LIFE! I found=20
this on a bulletin board and<BR>decided to try it. A little while back, =
I was=20
browsing through newsgroups<BR>I came across an article similar to this =
that=20
said you could make thousands of dollars within<BR>weeks with only an =
initial=20
investment of $6.00! So I thought, "Yeah right, this must be a scam",=20
but<BR>like most of us, I was curious, so I kept reading. Anyway, it =
said that=20
you send $1.00 or $2.00 for Canadian <BR>citizens to each of the 6 names =
and=20
address stated in the article. You then place your own name and address =
<BR>in=20
the bottom of the list at #6, and post the article in at least 200 =
newsgroups.=20
(There are thousands) No<BR>catch, that was it. So after thinking it =
over, and=20
talking to a few people first, I thought about trying<BR>it. I figured: =
"what=20
have I got to lose except 6 stamps and $6.00, right?" Then I invested=20
the<BR>measly $6.00. Well GUESS WHAT!! Within 7 days, I started getting =
money in=20
the mail! I was<BR>shocked! I figured it would end soon, but the money =
just kept=20
coming in. In my first week, I made<BR>about $25.00. By the end of the =
second=20
week I had made a total of over $1,000.00! In the third<BR>week I had =
over=20
$10,000.00 and it's still growing. This is now my fourth week and I have =
made=20
a<BR>total of just over $42,000.00 and it's still coming in rapidly. =
It's=20
certainly worth $6.00, and 6<BR>stamps, I have spent more than that on =
the=20
lottery!! Let me tell you how this works and most<BR>importantly, why it =
works.=20
Also, make sure you print a copy of this article NOW, so you can =
get<BR>the=20
information off of it as you need it. I promise you that if you follow =
the=20
directions exactly, that<BR>you will start making more money than you =
thought=20
possible by doing something so easy!<BR>Suggestion: Read this entire =
message=20
carefully! (print it out or download it.) Follow the =
simple<BR>directions and=20
watch the money come in! It's easy. It's legal. And, your investment is =
only=20
$6.00<BR>(Plus postage) IMPORTANT: This is not a rip-off; it is not =
indecent; it=20
is not illegal; and it is<BR>virtually no risk - it really works!!!! If =
all of=20
the following instructions are adhered to, you will<BR>receive =
extraordinary=20
dividends. PLEASE NOTE: Please follow these directions EXACTLY, =
and<BR>$50,000=20
or more can be yours in 20 to 60 days. This program remains successful =
because=20
of the<BR>honesty and integrity of the participants. Please continue its =
success=20
by carefully adhering to the<BR>instructions. You will now become part =
of the=20
Mail Order business. In this business your product<BR>is not solid and =
tangible,=20
it's a service. You are in the business of developing Mailing Lists.=20
Many<BR>large corporations are happy to pay big bucks for quality lists. =

However, the money made from<BR>the mailing lists is secondary to the =
income=20
which is made from people like you and me asking to<BR>be included in =
that list.=20
Here are the 4 easy steps to success: STEP 1: Get 6 separate pieces =
of<BR>paper=20
and write the following on each piece of paper "PLEASE PUT ME ON YOUR=20
MAILING<BR>LIST."Now get 6 US $1.00 bills or a Twoonie and place ONE =
inside EACH=20
of the 6 pieces of paper so<BR>the bill will not be seen through the =
envelope=20
```

```
(to prevent thievery). Next, place one paper in each of<BR>the 6 =
envelopes and=20
seal them. You should now have 6 sealed envelopes, each with a piece =
of<BR>paper=20
stating the above phrase, your name and address, and a $1.00 bill or =
Twoonie .=20
What you are doing is<BR>creating a service. THIS IS ABSOLUTELY LEGAL! =
You are=20
requesting a legitimate service and<BR>you are paying for it! Like most =
of us I=20
was a little skeptical and a little worried about the legal<BR>aspects =
of it=20
all. So I checked it out with the U.S. Post Office (1-800-725-2161) and=20
they<BR>confirmed that it is indeed legal! Mail the 6 envelopes to the =
following=20
addresses:</FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>#1)Sherry Beth 345 Pacific Ave. N. #DD7 =
Pacific, WA=20
98047 : <BR>#2)Joseph Erickson 16050 Hare Creek road - Corry, PA 16407 : =

<BR>#3)Fabien Thillet 1836 Beach Drive, Box 36 Gulfport 39507, =
MS<BR>#4)R. Blair=20
418 10th Ave NW Calgary, Alberta, Canada t2m0b5<BR>#5)R. Bates 620 =
Crescent R.D=20
N.W Calgary, Alberta, Canada T2M-4A6 &lt;----- Very popular=20
list<BR>#6)Franck-Alix Julien 1090 kristin way Apt. 811, Ottawa, =
Ontario, Canada=20
K1K4B6 &lt;----- Very popular list<BR>if more money is sent time on the =
list is=20
then increased</FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: STEP 2: Now take the #1 name off the =
list that=20
you see above, move the other names up (6<BR>becomes 5, 5 becomes 4, =
etc...) and=20
add YOUR Name as number 6 on the list. STEP 3: Change<BR>anything you =
need to,=20
but try to keep this article as close to original as possible. Now, post =

your<BR>amended article to at least 200 newsgroups. (I think there are =
close to=20
24,000 groups) All you<BR>need is 200, but remember, the more you post, =
the more=20
money you make! This is perfectly legal!<BR>If you have any doubts, =
refer to=20
Title 18 Sec. 1302 &amp; 1341 of the Postal lottery laws. Keep a<BR>copy =
of=20
these steps for yourself and, whenever you need money, you can use it =
again, and=20
again.<BR>PLEASE REMEMBER that this program remains successful because =
of the=20
honesty and integrity<BR>of the participants and by their carefully =
adhering to=20
the directions. Look at it this way. If you are<BR>of integrity, the =
program=20
will continue and the money that so many others have received will =
come<BR>your=20
way. NOTE: You may want to retain every name and address sent to you, =
either on=20
a<BR>computer or hard copy and keep the notes people send you. This =
VERIFIES=20
that you are truly<BR>providing a service. (Also, it might be a good =
idea to=20
wrap the $1 bill or a Twoonie for Canadian citizens<BR>in dark paper to =
reduce=20
therisk of mail theft.) So, as each post is downloaded and the =
directions=20
<BR>carefully followed, sixmembers will be reimbursed for their =
participation as=20
a List Developer with one dollar each. <BR>Your name will move up the =
list=20
geometrically so that when your name reaches the #1 position you =
will<BR>be=20
receiving thousands of dollars in CASH!!! What an opportunity for only =
$6.00=20
($1.00 for each<BR>of the first six people listed above) Send it now, =
add your=20
own name to the list and you're in<BR>business! DIRECTIONS FOR HOW TO =
POST TO=20
NEWSGROUPS------------ STEP 1)<BR>You do not need to re-type this entire =
letter=20
to do your own posting. Simply put your cursor at the<BR>beginning of =
this=20
letter and drag your cursor to the bottom of this document, and select =
'copy'=20
from<BR>the edit menu. This will copy the entire letter into the =
computer's=20
memory. STEP 2) Open a blank<BR>'notepad' file and place your cursor at =
the top=20
of the blank page. From the 'edit' menu select<BR>'paste'. This will =
paste a=20
copy of the letter into notepad so that you can add your name to the=20
list.<BR>STEP 3) Save your new notepad file as a text file. If you want =
to do=20
your postings in different<BR>settings, you'll always have this file to =
go back=20
to. STEP 4) Use Netscape or Internet explorer and<BR>try searching for =
various=20
newsgroups (on-line forums, message boards, chat sites, =
discussions.)<BR>STEP 5)=20
Visit these message boards and post this article as a new message by=20
highlighting the text<BR>of this letter and selecting paste from the =
edit menu.=20
Fill in the Subject, this will be the header that<BR>everyone sees as =
they=20
```

```
scroll through the list of postings in a particular group, click the=20
post<BR>message button. You're done with your first one!=20
Congratulations...THAT'S IT! All you have to<BR>do is jump to different=20
newsgroups and post away, after you get the hang of it, it will take =
about<BR>30=20
seconds for each newsgroup! **REMEMBER, THE MORE NEWSGROUPS YOU =
POST<BR>IN, THE=20
MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM<BR>OF 200** =
That's it!=20
You will begin receiving money from around the world within days! You=20
may<BR>eventually want to rent a P.O.Box due to the large amount of mail =
you=20
will receive. If you wish to<BR>stay anonymous, you can invent a name to =
use, as=20
long as the postman will deliver it. **JUST<BR>MAKE SURE ALL THE =
ADDRESSES ARE=20
CORRECT.** Now the WHY part: Out of 200<BR>postings, say I receive only =
5=20
replies (a very low example). So then I made $5.00 with my name at<BR>#6 =
on the=20
letter. Now, each of the 5 persons who just sent me $1.00 make the =
MINIMUM=20
200<BR>postings, each with my name at #5 and only 5 persons respond to =
each of=20
the original 5, that is<BR>another $25.00 for me, now those 25 each make =
200=20
MINIMUM posts with my name at #4 and<BR>only 5 replies each, I will =
bring in an=20
additional $125.00! Now, those 125 persons turn around<BR>and post the =
MINIMUM=20
200 with my name at #3 and only receive 5 replies each, I will make=20
an<BR>additional $626.00! OK, now here is the fun part, each of those =
625=20
persons post a MINIMUM<BR>200 letters with my name at #2 and they each =
only=20
receive 5 replies, that just made me<BR>$3,125.00!!! Those 3,125 persons =
will=20
all deliver this message to 200 newsgroups with my name<BR>at #1 and if =
still 5=20
persons per 200 newsgroups react I will receive $15,625,00! With an=20
original<BR>investment of only $6.00! AMAZING! When your name is no =
longer on=20
the list, you just take the<BR>latest posting in the newsgroups, and =
send out=20
another $6.00 to names on the list, putting your<BR>name at number 6 =
again. And=20
start posting again. The thing to remember is: do you realize =
that<BR>thousands=20
of people all over the world are joining the internet and reading these=20
articles<BR>everyday?, JUST LIKE YOU are now!! So, can you afford $6.00 =
and see=20
if it really works?? I<BR>think so... People have said, "what if the =
plan is=20
```

```
played out and no one sends you the money? So<BR>what! What are the =
chances of=20
that happening when there are tons of new honest users and new<BR>honest =
people=20
who are joining the internet and newsgroups everyday and are willing to =
give it=20
a<BR>try? Estimates are at 20,000 to 50,000 new users, every day, with =
thousands=20
of those joining the<BR>actual internet. Remember, play FAIRLY and =
HONESTLY and=20
this will really works !!</FONT></DIV>

Amazing but true! It is SO WONDERFUL how everyone became
rich by simply scamming everyone else, all at the same time!

```

Hello all.

I need some help getting my Chromopix SSTV interface working. I have had it since it was made available and I have had a trouble free run with it. This runs from the sound card.

About a week ago I started having problems. At about that time I installed 'LOGGER" forPSK31. there appeared to be a conflict between the two. Everytime I started 'logger' it would immediately bring the FT990 transmit led on. It really was in a 'ready to go' position. So I had to switch off the TXmitter and the computer (making sure that 'logger' was in the off position). In doing this I can now use the computer and radio as one or separately.

I uninstalled the 'Logger' software and I still have the same problem mentioned above.

Would some kind amateur please help me sort this out.

Many thanks
Jim. (zl2bmh@free.net.nz)

It is like buying shares in an "Internet" company and watching them skyrocket... or take a deep plunge.

Rob Janssen <nomail@rob.knoware.nl> wrote:

> A more stable and unified API would help the availability of (semi) commercial applications, but apparently that is not a priority for Linux developers. This sometimes is a shame.

Sometimes. The kernel does seem to have good backwards compatibility though, which is certainly an asset. Or sometimes the userspace tools will emulate an old interface. For example the upgrade from ipfwadm to ipchains in Linux 2.0 to Linux 2.2.

The sound API is a definate sore point. Plain sampling can be done by reading /dev/dsp or /dev/audio, but anything fancy like setting the sampling rate requires IOCTLs, which aren't necessarily standard between ALSA and OSS.

I'm happy to see OSS die out, unless 4Front-Tech stops the OSS/Linux versus OSS/Free thing (unlikely).

Hi guys.

Just to say that Nick UT2UZ has released version 1.45 of MixW32.

I have it on my download page if you need it.

http://www.g3vfp.co.uk

Best Regards,

Dave G3VFP.

Yes, I have also used logger. There is a software module that you have to download with Logger that allows it to operate with the 1278B.

Regards,

Duffy - WB8NUT

Debatable whether this is "digital" or not, but it's required for a "digital"
application  -  does anyone in the UK have one of the old Datong
Woodpecker Blankers which they wish to sell?

Please email me directly if so.

The trouble with socialism, is that some people cheat, and
don't pay their share.

I'm sure some one must have come across this before.. I've always liked lan-link but it would always fail on my Pentium II 266mhz machine.. run fine on the old 8088 IBM pC in the garage. I got Runtime error messages. I found out this is a failure of an internal timing calc built into Borland Turbo Pascal code. I was running lan-link v2.34.

The fix is to patch the lan-link exe files using tppatch.exe found on the following website:

http://www.brain.uni-freiburg.de/~klaus/pascal/runerr200/download.html

Have you ever read the verse where Jesus said I and the Father (talking about God) are one? Or the verse in Acts that says there is no other name which can save you? Jesus is fully God and fully man, and therefore can call Himself both man and God.

Your points do not corrospond to the Bible. Read the Bible, forget your personal beliefs/bias and trust Jesus as your Lord and Saviour. Try reading John, Acts and Romans.

I'm running an APRS Station in the car, with no TNC in the house. I've been using WinAPRS for a couple of weeks now, for TCP/IP Only, as I can't do anything else with a non-registered copy.

Because I have no TNC in the house, is it worthwhile Buying this software? How much will I actually be able to do without a TNC? Can I message local stations through Digipeaters, Just like I would be able to do with a TNC and a Radio?

Any information will be deeply appreciated. TIA.

First:

Go down to Radio Shack and buy a multi-meter. In 17 years you should have acquired one by now. With this device, no pin-out or audio output is beyond your capability to map and decode, or calibrate. Volt's and Ohm's are simple to learn.

Second:

You're going to have to have another ham report on your PSK signal, as it will be easy to overdrive. Measure the audio level for a future reference. An O'scope is better, look for one.

Being a capitalist society, our government doesn't subsidize these
sorts of things. We are trying hard, but we are not fully socialist yet.
Under the Gore-Hillary administration, we should be able to pretty
much fulfill the dream of all Democrats, to have a socialist nation
much like the Netherlands and Great Britain.

Our government doesn't either. In fact they cash in large amounts of
money from the companies operating these services, for the spectrum
they operate in.

This discussion has little to do with mobile phones for kids, I think.

I'm curious about several things:

Don't you have local resources you can draw on? Doing stuff like
this over the Internet seems a pain, though people insist on doing
it anyway.

Why do so many hams draw a blank when they interface sound cards
to radios, anyway? It's just wires.

What ever happened to troubleshooting? If it doesn't work perfectly
when first plugged in, people seem to give up these days...

When I read Stew's proposal to sink money into selling wireless toys, it made me think just how far ahead the GSM world already is in terms of deployment and maturity. Stew - save your money, or, better yet, invest it in one of the real wireless companies.

The wireless telcos realize the money to be made, and they're happy to make it one penny at a time.

Stew, have you read GSM 07.05 and 03.40 ? Considering your zeal for blurring the lines between amateur radio and other radio services, I'm surprised you're not all over this.

Non-sequitor. Our wireless carriers are happy to subsidize the phones and sell the service rather cheaply. Here in Northern California, my GSM service plan includes 500 peak minutes, 1000 off-peak, free roaming in CA and NV, free domestic long-distance and 300 free SMS messages, for about $60/month. Oh, can't forget voice mail, and bidirectional email-SMS capability and caller-ID.

Especially on weekends, my POTS lines see few outgoing telephone calls.

There are family calling plans now that make family radios look silly for anything but camping in the backwoods where there is no coverage.

Socialism has nothing to do with it - this is capitalism, hard and fast. The fact is, even in Europe it's capitalism.

> We are trying hard, but we are not fully socialist yet.
> Under the Gore-Hillary administration, we should be able to pretty
> much fulfill the dream of all Democrats, to have a socialist nation

Major non-sequitor.

Yes - the USA is years behind Europe and Japan in this area, and
is "stuck in the mud" trying to convert some frequency space(broadcast
```

TV channels 60-69), in order to "auction it off" to the highest bidders
to support the very services you and I speak of. But this could take
YEARS! And so we fall farther and farther behind the world in
technology! It is actually possible to do many of the mobile PDA
applications, using existing inexpensive ham technology, on ham freqs
right now - don't believe what you hear from the old "PBBS tight-
sphinctered naysayers".

Thanks for the info - I'll check it out next week. I work on my remote
Rosarito homesite on the weekends, and I only have a 1200bps packet
link set up down there so far. Eventually, I'll be able to go thru an
Internet Gateway at my place in San Diego.

Well excuusse me - The reason news groups were put together was to share ideas and information, but apparently this one is only to put down people with questions. Thank you to those who gave me the helpful advice. And to the rest of you, The next time you hear about amateur radio losing popularity, you can pat yourselves on the back, puff up and exclaim loudly in the ng's, "Yep, and I helped! They were probably too dumb to understand it anyway....."

Um Stew ... you just directly responded to Charles.

Ya gonna get that startup going, ya better spend less time here, and more time putting together the business plan. Of course it has already been done, in Japan and in Europe, and there are three companies about to roll it out here in the US, but that shouldn't stop you.

It's even worse than that. There are several companies about to roll
out some interesting messaging services in the US. Have looked at
three of them in some detail, prior to investing. No need to wait for new
freqs to open up, plenty of ways to do it via mods to existing services.

No telephone service in Rosarito?

Mark 12:29 And Jesus Answered Him, The First Of All The Commandments Is, Hear, O Israel; The Lord OUR God Is One Lord:

This is the first commandment that Jesus gave and that is "The Lord OUR God Is One Lord". If Jesus only said: "The Lord YOUR God Is One Lord" ,there would have been some ambiguity as to whether Jesus was God. But Jesus said �The Lord OUR God Is One Lord� therefore he removed all ambiguity by his utterance so that no one can ever rightly say that Jesus was God. Someone who has a God can never be your God. This is the first commandment of Jesus yet we see that the majority of Christiandom break this very first commandment by making Jesus their God and then they think they are saved and will inherit paradise. Such a belief is totally unbiblical and against the teachings of Jesus.

Jesus said:

Mt 19:17 And He Said Unto Him, Why Callest Thou Me Good? There Is None Good But One, That Is, God: But If Thou Wilt Enter Into Life, Keep The Commandments.

Jesus didn't say "take me as your personal savior and you will go to heaven" he said "Keep The Commandments", yet most Christians break the very first commandment of Jesus in the Bible let alone other commandments, by taking Jesus as a God and then they expect to go to heaven! It is one of the strangest religious phenomenon in existence.

Jesus said:

Mt 5:20 For I say unto you, That except your righteousness shall exceed the righteousness of the scribes and Pharisees, ye shall in no case enter into the kingdom of heaven.

Righteousness is not defined by faith alone but through faith and deeds, and Jesus is saying that heaven is not for you if your righteousness is not better than the practicing jew. Now we shall look at other biblical verses that make the picture more clear, though the above is quite sufficient for those that are truthful to themselves:

Num 23:19 God Is Not A Man, That He Should Lie; Neither The Son Of Man, That He Should Repent: Hath He Said, And Shall He Not Do It? Or Hath He Spoken, And Shall He Not Make It Good?

This verse is in the Old Testament and it is quite explicit and clear. No man can be God. Not only that but no son of man can be God. The New Testament did not come to contradict the Old Testament; it came to fulfill it so it is obvious that Jesus was not God.

John 9:11 He Answered And Said, A MAN That Is Called Jesus Made Clay, And Anointed Mine Eyes, And Said Unto Me, Go To The Pool Of Siloam, And Wash: And I Went And Washed, And I Received Sight.

Mt 8:20 And Jesus Saith Unto Him, The Foxes Have Holes, And The Birds Of The Air Have Nests; But The SON OF MAN Hath Not Where To Lay His Head.

Jesus is called both a man and the son of man in the New Testament so many times.

Job 25:4-6 How Then Can Man Be Justified With God? Or How Can He Be Clean That Is Born Of A Woman? Behold Even To The Moon, And It Shineth Not; Yea, The Stars Are Not Pure In His Sight. How Much Less Man, That Is A Worm? And The Son Of Man, Which Is A Worm?

This verse shows that man can not even be rightly compared to God (let alone be God). Nothing is pure or clean compared to God. We are all like worms compared to God. Even the son of man is like a worm compared to God (there is no comparison). It is very interesting that the verse states that "How Can He Be Clean That Is Born Of A Woman". Jesus was born of a women, though Mary was the holiest of women but she was still a woman. So in the biblical terminology even Jesus is not pure compared to God so how in heaven or earth can anyone call him God? This reminds me of the well recorded statement of Jesus recorded in the New Testament so many times:

Luke 18:19 And Jesus Said Unto Him, Why Callest Thou Me Good? None Is Good, Save One, That Is, God.

Mark 10:18 And Jesus Said Unto Him, Why Callest Thou Me Good? There Is None Good But One, That Is, God.

Mt 19:17 And He Said Unto Him, Why Callest Thou Me Good? There Is None Good But One, That Is, God: But If Thou Wilt Enter Into Life, Keep The Commandments.

Jesus is repeatedly saying, "I am not good, only God is good, I am not pure, only God is Absolutely Pure and Holy and glorious is His name. If you want to go to heaven KEEP THE COMMANDMENTS. " But what do we say? We say "If you want to go to heaven call Jesus GOD and believe he died for you!" It is so unbiblical let alone against common sense.

Jesus says:

John 20:17 Jesus Saith Unto Her, Touch Me Not; For I Am Not Yet Ascended To My Father: But Go To My Brethren, And Say Unto Them, I Ascend Unto My Father, And Your Father; And To My God, And Your God.

Jesus is calling God both my God and your God, my Father and your Father. If Jesus has a God Jesus can't be God. It is simple common sense. If Jesus was God who did Jesus pray to, himself? Imagine Jesus (if he was God) falling on his face praying to himself? God does not pray, but his servants pray to Him.

John 11:42 And I Knew That Thou Hearest Me Always: But Because Of The People Which Stand By I Said It, That They May Believe That Thou Hast Sent Me.

Mt 26:39 And He Went A Little Farther, And Fell On His Face, And Prayed, Saying, O My Father, If It Be Possible, Let This Cup Pass From Me: Nevertheless Not As I Will, But As Thou Wilt.

Heb 5:7 Who In The Days Of His Flesh, When He Had Offered Up Prayers And Supplications With Strong Crying And Tears Unto Him That Was Able To Save Him From Death, And Was Heard In That He Feared;

Mt 27:46 And about the ninth hour Jesus cried with a loud voice, saying, Eli, Eli, lama sabachthani? that is to say, My God, my God, why hast thou forsaken me?

Mark 15:34 And at the ninth hour Jesus cried with a loud voice, saying, Eloi, Eloi, lama sabachthani? which is, being interpreted, My God, my God, why hast thou forsaken me?

Luke 5:16 And he withdrew himself into the wilderness, and prayed.

Luke 22:44 And being in an agony he prayed more earnestly: and his sweat was as it were great drops of blood falling down to the ground.

Mt 26:36 Then cometh Jesus with them unto a place called Gethsemane, and saith unto the disciples, Sit ye here, while I go and pray yonder.

Mt 4:10 Then saith Jesus unto him, Get thee hence, Satan: for it is written, Thou shalt worship the Lord thy God, and him only shalt thou serve.

Lu 4:8 And Jesus answered and said unto him, Get thee behind me, Satan: for it is written, Thou shalt worship the Lord thy God, and him only shalt thou serve.

We all know that only God is omnipotent. God can do anything He wills. He has full power over all of His creation. If somone admits that he/she is not omnipotent it is obvious as the sun that that person can never be God. So what did Jesus say about this?

John 5:30 I Can OF MINE Own Self DO NOTHING: As I Hear, I Judge: And My Judgment Is Just; Because I Seek Not Mine Own Will, But The Will Of The Father Which Hath Sent Me.

John 12:49 For I have not spoken of myself; but the Father which sent me, he gave me a commandment, what I should say, and what I should speak.

John 7:16 Jesus Answered Them, And Said, My Doctrine Is Not Mine, But His That Sent Me.

John 8:42 Jesus Said Unto Them, If God Were Your Father, Ye Would Love Me: For I Proceeded Forth And Came From God; NEITHER CAME I OF MYSELF, But He Sent Me.

John 17:3 And This Is Life Eternal, That They Might Know Thee The Only True God, And Jesus Christ, Whom Thou Hast Sent.

John 6:29 Jesus Answered And Said Unto Them, This Is The Work Of God, That Ye Believe On Him Whom HE Hath Sent.

Let alone claiming to be omnipotent, not only does Jesus admit that he is not but he says that he is capable of doing absolutely nothing on his own. That is how humble he is before his Creator. He furthermore admits that there is a difference between his will and the will of God but that which makes him special is that he seeks the will of God and not his own will. He furthermore clarifies that God sent him. If Jesus was God he wouldn't say God sent him, he would say I came on my own power and leave. Imagine someone saying "I sent myself"! It doesn't make any sense at all to say that Jesus is God.

Joh 13:16 Verily, verily, I say unto you, The servant is not greater than his lord; neither he that is sent greater than he that sent him.

Joh 14:28 Ye have heard how I said unto you, I go away, and come again unto you. If ye loved me, ye would rejoice, because I said, I go unto the Father: for my Father is greater than I.

We all know that only God knows everything. God is omniscient. If someone admits that they don't know everything that person can never be God. It is very obvious. So what did Jesus say about knowing everything?

Mr 13:32 But of that day and that hour knoweth no man, no, not the angels which are in heaven, neither the Son, but the Father.

Mt 24:36 But of that day and hour knoweth no man, no, not the angels of heaven, but my Father only.

Jesus admits that he does not have knowledge of the hour (the day of Judgement). Only God knows that. Therefore it is clear that Jesus is not God. A lot of poor christians take the words of Jesus out of context and interpret it the way they want to believe but Jesus himself makes the meanings of his words quite clear for those that want to listen. Some take the words of Jesus "I and my father are one" to mean that Jesus is God. Such poor christians are unfair only to themselves. Jesus explains the meaning of biblical oneness:

John 17:21 That They All May Be One; As Thou, Father, Art In Me, And I In Thee, That They Also May Be One In Us: That The World May Believe That Thou Hast Sent Me.

So looking at the above verse do you ever hear anyone saying that all of us are also God because Jesus is one with the Father and we are all one with the Father and Jesus? Of course not, so why deliberately misinterpret the words of Jesus? The �oneness� that Jesus talks about is oneness in purpose.

Lastly I will quote something that alone makes the truth clear for those that want to see:

1Jo 4:12 No man hath seen God at any time. If we love one another, God dwelleth in us, and his love is perfected in us.

1Ti 1:17 Now unto the King eternal, immortal, invisible, the only wise God, be honour and glory for ever and ever. Amen.

1Ti 6:16 Who only hath immortality, dwelling in the light which no man can approach unto; whom no man hath seen, nor can see: to whom be honour and power everlasting. Amen.

No man can see God. Jesus was seen therefore Jesus is not God. It is simple as 1+1=2 but for those that have been indoctrinated (brain-washed) since childhood that 1+1+1=1, no wonder so many people can't see straight!

peace,

cvostsqribbnbmgsgptvcsyxiuewxtenjttnkxqsemqxkuzjyvbboxccxrrdufshtokermxf

The inbuilt TNC of the TH-D7 is awful for data transmission with PC! Is it
possible to connect the Kenwood TH-D7 transceiver to an external 9k6 bps TNC?
Parts need to be replaced on the PCB or only "wiring"?

Please give me some clues!

Clue 1:

Sell the God damn thing, and get a real radio.

Apparently some of you people from the USA seem to think that the entire
```

world outside of their country is socialist, and the governments of all those countries are "giving away" services to their inhabitants.

This is not the truth. The companies operating the mobile phone system over here (and in most other countries) are fully commercial operations, and are operating on frequencies that they bought during an auction just like that. In fact, most are already operating on 1800 MHz as the 900 MHz band you mention was already completely used several years ago.

Unfortunately, European consumers are now suffering from the "European Community" problem, where all the companies in the European countries think they will be better off when they operate in another country than their original home country, and end up fighting over the scarce spectrum space during those auctions.

So, everyone ends up paying way too much, and the only way to recover those costs is by letting the consumer pay more. They can only hope to get something back via their governments (who received the money and are supposedly doing something for the country with it). But in the case of the Netherlands, the parties came to agreement pretty quickly and the total sum was way less than expected. In Germany, our neighboring country, the reverse happened and everyone paid WAY too much. Now, some of the parties involved in that mishap are also active in the Netherlands and so our customers will end up paying without any chance of getting any returns...

In fact one can be surprised that a country like the USA, which is supposed to be capitalist, is using this auction system. It will bring money from the consumer to the government, which you people are so eager to claim is a socialist system.

Rob

I do not know of any others that 'do it all' but you can find most FSK
modes covered by free or inexpensive software. Which modes were you
interested in?
PSK has dozens of free packages.
RTTY / AMTOR works very well with TrueTTY (DXSOFT.COM)
SSTV / FAX ... search the web, a number of good freebies for sound card
are out there.
Others modes are available too but you'll need to search for them.
The other way to go is to buy an all mode TNC (PK-232 etc.), they
usually come with the software, cover most modes and are available used
for a decent price!
....
Please... if you do find an inexpensive all mode sound card decoder
please POST it here.... I, and others, would be interested.

With a deficit of 5 Trillion, we have to be creative in ways of manufacturing
more money, to pay for the programs our representatives think we need.

There's a distinction that should be made here -- Europe is "socialist" in the sense of social engineering: high taxes going to support a welfare state; belief that the government needs to intervene in peoples' lives because the individual is society's responsibility; things like that.

It doesn't mean that capitalism is extinct in Europe.

As i see it, if a GOVERNMENT were to subsidize the phones (in Europe telecommunications are mostly government-owned, right?) that would be a socialistic practice, but if a carrier subsidizes the phones, that is NOT socialism as it is commonly defined.

Whoever is doing the subsidizing, tho, is engaging in some kind of social engineering: trying to get people to do certain things, live in certain kinds of ways. Some of us think it's better for the engineering to be decentralized, rather than all in the hands of one monolithic organization (like the government).

So if a ham radio packet-internet gateway provides e-mail service to the radio-side users, it's illegal because they could get that service from a commercial provider? I don't think so. In 1997-98 i was doing just this, and was in communication with dozens of other hams doing it as well. Where are you getting the fuel for this allegation?

N0MHS wrote (i'm cutting & pasting, hope it was N0MHS):

Exactly.

> Quit spreading false rumors - you aren't "God" anymore.

The internet has had a democratizing influence on amateur radio -- the gods can't STAND it.

Hi to all !

I want to try with 9k6 packet radio (until now I have played well with
1k2), and don't know
what radio to use . Now I can choose between :
kenwood tmg-707 , which as a built-in 9k6 data port , or
standard c-528 , for which are available a lots of mods ...

Any advice?

I'm just a stundent, so don't want to throw away my money ....

No, telecoms are no longer government-owned. We now have the same
mess as in the USA. Even worse, when mobile telephony is concerned.

To remain alive, operators have to give away phones. In fact, the
government doesn't like this practice.

The two parties running for administration are pissing all over themselves
on how to spend the annual surplus. My math says you don't have any
surplus until you repay the loan.

Our deficit represents about $14,000 for every man, woman, and child
in the U.S. (plus or minus the Federal Reserve Interest Rate).

We are hoping that foreign workers will come here and pay taxes too!

Going through USCFR 47 part 97, I can't find just what you're referring to here. Using the same logic, using an autopatch is illegal because one can use a cell phone too.

And in fact it *is* illegal for many potential uses.

Perhaps you should try reading Part 97 more carefully, the sections
about permitted transmission.

Hardly. Consider the liquidation value.

Those who quote silly numbers as above always forget the
other side of the balance sheet. He meant to say "debt" not
"deficit". A deficit means there is more debt than assets, and
that is simply not true. The US has a much larger balance
on the asset side of the balance sheet than it has on the debt
side of the balance sheet. There is no deficit, there is actually
a surplus. A very large surplus. But this discussion belongs in
a different newsgroup.

Want to buy Yellowstone? What would it bring at auction?
How about the Bonneville power system? The interstate freeways?

Another hint: where is the Social Security balance held?
Consider discounted current value of bonds.

What is meant by "... manufacturing more money ..."?

i.e. it's just another troll from a dead guy.

Good question. Do some companies sell cables for connecting
Morse keys to rigs as well? It sounds like some people would need it.

(Or do some keys come with cables too? My Hi-Mound didn't,
and my FT-847 has an odd key connector anyway.)

It's not very common, but try around 14063 kHz or so.
The new mode MFSK16 (http://www.qsl.net/zl1bpu/ for information)
is a bit easier to use and is similar in principle (ie multiple
frequency shift keying).

Regards
Hamish

Hi TNX for reading,

I recently bought a TNC MFJ 1278B together with the original software (mfj
1289).

Does anyone know if I can also use other software on this modem?
And if so where to find it ??

Tnx de PA3DWC, Gerrit

No I didn't buy/order the 2m/70cm transceiver yet.
Maybe you know other handy-transceivers (2m/70cm) suitable for my needs.

Should do/have:

- 2m/70cm TX(at least @2m) and RX both - high power transmission output (at least 5 W) - good sensivity - no TNC as TH-D7, but at least modifiable(better a socket) for connecting a 9k6 modem/TNC. - a mobile with <3A ("draw"?) at 5watts output would suit too but is maybe not available.

I have carefully. The entire point is that for example, one can now order a pizza using an autopatch if one has no financial interest in the pizza business. Once behavior like that was banned, but now it isn't. It's also a joke as I have yet to hear a pizza or similar item ordered over an autopatch. Similarly, we could have this discussion on packet radio despite having internet access as far as I can tell. Of course the reliability of messages getting through would be less. If you're correct, then packet radio for the most part shouldn't exist at all except for things like APRS. Reading your interpretation literally, most of amateur radio shouldn't exist.

I understand the difference between commercial interest and no commercial interest.
Looking at 97.111, 97.113, 97.115, 97.117, and 97.121, I don't see what you're claiming. Which section are you claiming should be applicable? I understand also the prohibition on REGULAR transmissions if there is another available service, but you imply a total ban, which doesn't exist.

Read about automatic control and third party messages.
The topic was handling internet email via ham radio.

I implied no such thing.

The topic was the regular handling of internet email via ham radio, to
avoid the use of a common carrier internet connection.

MJF has 1289W for Windows @
http://www.mfjenterprises.com/software/mfj1289.html
Not sure if it's been updated since 1993.

Yes, you can use other software, authors usually indicate what TNCs will work.

W5MTV

Probably because a lot of the problems are flaky software and flaky device drivers; the wiring part is trivial.

I have a dual boot machine that runs Linux and Windows 98. It is interfaced to the radio.

Under Linux I run twpsk, and except for an occasional core dump, runs pretty well.

Under 98, I have (so far) tried WinPSKse and DigiPan.

WinPSKse runs fine immediatly after an install. If you quit the program then re-run it, all sorts of flaky things happen; sometimes it won't receive, sometimes it won't transmit. If you delete all the registry entries for it, it will run fine until you exit the program again.

I have never gotten DigiPan to receive anything or show any sign that it is listening or talking to the sound card.

Keep in mind this is the same hardware in all cases.

Not to mention that most who write Microsoft Windows apps don't relese
the source code. This means that if they don't test under every Windows
software/hardware you're screwed if it doesn't work.
Linux devlopers on the other hand normally release as Open Source or
under the GNU license. This way if it doesn't work, the reason can be
found by the user, if they are so inclined, corrected and the correction
submited to the orginal author for inclusion in a future release. This
is what made Linux the great stable OS it is today. Not hiding
everthing, but leaving it open so if a bug is found, the finder might be
able to fix it. Or, even better another might make changes for his own
preferences, or add enhancements.

This post does not help much. EXACTLY what reflector. There are MANY PSK31 reflectors.

Egroups.com has the most and the best.

I hear there is an after market map CD that will work (overlay) with APRS.

If true, what is it, and were do I get it.

I have searched the web, but can't seem to find it.

Thanks, and 73.

I am really beginning to think that you cannot tell the difference between commercial and Amateur. APRS is not a commercial venture. It is a system that was put together by hams, for hams, and no one makes a profit from it.

Commercial radios? What of it? How they are USED is what counts. Sure, you can design a product and sell it to hams for use on the ham bands, provided that using said product is not in violation of FCC rules. But you cannot design a product that (for example) allows hams to rebroadcast commercial radio and TV traffic over the ham frequencies, so that they can hear it down at the lake, where reception is poor.

>

Phone patches are legal PROVIDING that the traffic is not in contrary to FCC rules. For example, you cannot legally call your place or employment to conduct work related activities. You could not make sales calls over the autopatch either. Both of these are against the rules.

In the same vein, you can have packet radio, but the messages contained on it must be non-commercial, no advertizing, no spam (remember there is a no broadcast rule), nothing could transpire that could be interpreted as conducting business (Which means you cannot order some widget, pay your bills, sell amway, career E-bay'er etc) and the messages cannot be indecent, vulgar, obscene (so checking into your favorite nudie site is out).

Do you not yet see how hard it would be to allow direct connects to the internet backbone and filter out illegal content? Devices designed to filter on keywords, sites etc, can be gotten around very easily (ask any 12 yr old kid), so manual monitoring would still be required to keep the FCC happy.

But don't take my word for it. Send the FCC an E-Mail outlining your proposal, and see what THEY say. If you don't maybe I will.....

Dave

This was 2 years ago. Stanford had it, and the folks i was talking to in the San Jose and east-bay areas were going to get set up for it. They (and the jnos mailing list inhabitants) were very very helpful in getting me set up in 1997. Some of them probably frequent this newsgroup.

You ass needs a good spanking little one. When you can't argue a point
then put them down for spelling errors then right? This kind of
perfectionism we don't need. Stop filling the groups with YOUR spam
that's off topic.

My point was; our innovative forefathers didn't put up with this nay-
saying crap and neither should we. If you're not for innovation you're
against it.

I simply say again....
Don't you know if we could start providing some real benefits (both on
or off the Ham bands) people would take notice? What could be better
for Ham radio's future?

Look Charlie! Put down the broken beer bottle and shut the hell up. You
are obviosly stupid or you wouldn't have you real name posted is hear.
Your one sided neanderthal thinking isn't helping anyone.

My point is that wanting to change, enhance, ungrade and or fix the FCC
regs is NOT the same as disregaurd for them. I'm not talking about the
kind of childish repeater interference that you probably do yourself.
I'm talking about new tecnologies and REAL benefits. I do NOT condone
breaking the law. Open your eyes.

Your kind says they want to keep the ham bands from being sold off but

in truth you are a kin to CB'ers trying to commander the band for your
own special interest! What's more your know-it-all fat headed swill is
getting old. I don't care what you've accomplished technically if your
going to be an ass. This is a lesson that all Hams best consider or we
will stagnate or die until the old gaurd dies off. I'm not that young
and so I personally don't care to wait for the foolishness to stop.
Just cease and stop being a big baby!

Hugs and kisses

The Tekk radios can do 19.2kb if you replace the stock IF filters (at 21.4MHz)
with wider ones. PacComm in Florida sells a version that already has the mod,
or can provide the parts if you want to do it yourself. I'm not aware of the
Tekks being modified to run faster than that, though.

Well, I didn't think you were serious. Now that I see you really
are serious, I will only say that you are right and I am wrong.

I wish you the best success in designing new laws of physics
to do what you would like. I know that someone will eventually
find a way for microwaves to go through mountains, and for
forests to have 0 dB of attenuation. It may even be yourself!

Several of the regulars in this newsgroup would benefit greatly from a
little bit of SLACK. The place to learn about SLACK is the Church of Bob:

http://sunsite.unc.edu/subgenius/

...Also known as the church of the subgenius.

"He ain't no man, he ain't no god, I don't wanna walk the path 'Bob' trod."

Now at http://www.subgenius.com.

You're right. Ham radio newsgroups are traditionally slackless. I accept it as "cleansing the palate." A notable exception is the antenna group, agitated by the fractenna character (s?). Not really a troll, I believe fractenna is a rare channeling MetaTroll, oblivious to his own nature, staying 110% in character and causing some of the funniest flamefests I've seen this side of news:rec.sports.football.college .

Gratuitous on-topic material follows: Bought a Hustler 5/8 over 1/4 collinear 2-meter vertical antenna with tiny radial spokes at the local ham club el-cheapo auction last week. Turns out it also loads up on 10 meters. Worked France and Spain right off the bat this morning on psk31 with the darn thing. 40 watts.

Corry

Have you set up the sampling rate under the network options (I think
that's where it is)?  Without that, there is no sampling by the sound
card while you still hear audio.

I purchased a Rigblaster to try my hand at PSK31, and connected the jumpers and wires just the way the website had posted. (I have a Kachina) I get a pwr and a digital light. The PTT switch makes the digital light go away. However, no matter which PSK31 program I try, I cannot get any receive signal, although I can hear one through my headphones. I can test transmit as well. I haven't gotten an answer back from the rigblaster folks. I tried to set up the receive just like the manual said but I think I am missing something important. Any help??

Thank you -

Over the past few years many hams have experimented with the DSP 56002 EVM from Motorola. This board is now obsolete; so where do we go from here? I'm doing some desk research into what alternatives exist in order to establish the best way to move ahead. If you feel you can contribute, I would be very grateful.

Have you explored any of the later Motorola EVMs such as the 56009?

Were they compatible?

Were there any problems porting code from the 56002?

Have you tried any other DSP modules instead?

Please either respond here, or email me as mailto:gareth@g6kvk.demon.co.uk. (don't email my NTLWORLD account)

Does anyone know what the differences
are between the MFJ 1270, 1270B, and

the current model 1270C models?

The 1270 (no suffix) seems to be another knockoff of the TAPR TNC2, but I have not been able to find any other information relating to these units. A phone call to MFJ yesterday brought little additional information.

Thanks for your help and assistance.

John

The RigBlaster is not involved in receiving, only tranmitting. If you don't have a waterfall, you probably don't have enough audio signal coming from your radio to the input of the soundcard. Sometimes you have to use the speaker output on the radio and/or microphone input on the soundcard to get enough signal. On my IC-736, I take the audio from the accessory jack on the back, but then have to use the microphone input on the SoundBlaster to get enough signal. Make sure whichever input/output combination you are using, you have the corresponding input on the soundcard not muted and at a sufficient level.

Yes, same suggestion here. The IMPORTANT thing in my case was that there are many mixer controls on the average soundcard and you have to make sure that the right ones are turned up. Yes, it often requires multiple controls to be turned up. On the volume control applet, make sure that you have the properties set so that you see all of the controls, and that all of the controls are turned all the way up.

I'm not familiar with the 1270C, but as I recall the 1270 was pretty much identical to the TNC-2 (it was licensed by TAPR, not really a knockoff) with a different form factor. I don't know if it had some of the mods which were recommended, like removing the MF-10 filter.

The 1270B has that filter removed and also has provision for switching between 1200 and 300 baud. There was also a 1274 which was identical, except for the addition of an LED tuning indicator for HF.

At some point MFJ increased the amount of SRAM from 16K to 32K in the 1270B (required by later firmware).

Under properties in the Volume control, you have to select a window for
"record" which is recieve and for Playback, which is transmit.

The input you use should be ON in record and OFF in play back.

I also use the Mic in for my set up HOWEVER there is DC on the mic jack

which you should block from your rig using a capacitor or a transformer, or
both. (I use a 10Uf capacitor). The dc on the signal WILL distort the
recieive signal if not blocked, and in the case of my rig, that dc got back
into the audio ckts of the rig and caused improper squelch operation!

Stop making foolish assumptions and being a know it all. I never said to send the microwaves through the mountains. Most of us know the basics. This is the kind of snobery we DON'T need. The challange is HOW might we do it otherwise.

Of couse you missed my point that nay sayers like you ridiculed our inventive forefathers too. Get on the inventive bandwagon or get off the road. You're in the way.

73 anyway

This is the first so called "flame" I've ever written. I think it's
well written and has many good points. It's up to you to decide if it's
deserved.

When they are ridiculous laws - of course. The National 55mph speed limit WAS a ridiculous law. Whole States disobeyed it. Eventually it was overturned.

> > > Afraid that you are trying to preach to the wrong choir here.

> You call W5YR a lawbreaker?

The 55mph speed limit is not really that much of a law. If you were caught surpassing it(within moderation), you were guilty of an "infraction". You were NOT put in jail(as long as you paid your fine).

I view the perceived "content restrictions" on Amateur Internet access in much the same light. There are no clear cut rules. Hams sell ham gear all the time using amateur frequencies, and many even make a small living at it - that is somehow OK. As long as "blabbermouths" didn't go complaining to the FCC - we could also have free wireless access to the Internet. While anal-retentive spoil-sports have helped to restrict growth up to this point - it has really been the lack of applications that have stopped the growth of Internet-backboned packet systems. Now, with the increasing capabilities and dropping prices of PDAs - a new applications arena is beckoning(it might not involve Web access, but portable e-mail, chat, newsgroups, and stock quotes are VERY doable applications at 9600bps - even 1200bps). I say just try to ignore the spoil-sports, as they putter along in the slow lane at 55mph - blocking-up traffic. Besides, if they put up too much of a stink, we can always just use MURS!

there's a new PDA/gameboy/wireless gadget called the cybiko. It does
wireless digital communication. It's designed for kids, but they will be
releasing the software development kit and RF specs so we can write our own
wireless software. www.cybiko.com
if you use my secret code AD9211 you can get 20% off the $129 price.

So which is happening? Are you putting out 100 watts or no RF output?

And what did you do to fix your receive problems?

It certainly helps if you provide detailed descriptions of what your
problems are.

Hmmm...  How much does the monthly service cost?  What frequencies does
it operate on?

I'm working on a PUBLIC Internet-backboned system that will operate on
MURS frequencies, uses existing PDAs, and will be VERY low-priced.

This is not clear from the web site.

> What frequencies does it operate on?

900MHz device! Seems to run at 19200bps. I just found out that this kind of thing apparently is very popular in Japan. I had this kind of idea about two months ago, and have started a company(PubCel), and have been working on apps.

> I'm working on a PUBLIC Internet-backboned system that will operate on
> MURS frequencies, uses existing PDAs, and will be VERY low-priced.

I'm working on 9600bps applications on MURS VHF frequencies. The communications range should be MUCH higher on VHF. With 900Mhz UHF, you are very limited. Also, you can't do anything with the antenna to increase range. With MURS, we should be able to.

Note: TAPR is trying to do their radio on 900Mhz too!

Note: This device has a more restricted screen size than the $149 Palm MP100 160x100 vs. 160x160. Also, it has very little RAM 512K vs. 4Mb. However, it is cool that it has built-in RF capability. The kids are going to like being able to communicate with each other in class - I've got two teenagers, and this is what gave me the idea. But look at the range; 150ft indoor - 300ft outdoor. What a joke. I bet those are lab numbers, and you won't even get that(same with the TAPR FHSS project!). I need to take my company public.

And a nice Bronx cheer to all you old PBBS nincompoops who didn't see this coming. Try loosening up the old sphincters a little bit, and quit threating to "report" anyone doing Internet-backbone applications on ham freqs. These applications on these device are mostly e-mail, chat, and games, anyway. With cheap 19200bps capable TEKK radios, there is NO REASON why we can compete here, AND bring TONS of kids into the hobby at the same time.

While the "restrictive" attitude of some hams has restricted growth of Internet-backboned digital comms on the ham freqs, the real factor has been a lack of modern applications for low-moderate speed packet(1200-19200bps) - APRS being the exception. Now that PDAs are more capable, low/moderate speed packet has an opportunity to make a comeback. The difference this time will be that the backbone will be the Internet, instead of the kooky HF-forwarding PBBS forwarding system of the late 80's and early 90's(which functioned very much like a Internet newsgroup, but much slower, and much less reliably!). Do you know who the BIGGEST opponents of Internet-backboned systems are? Why, none other than a group of aging PBBS HF message forwarding system operators. These "spoil-sports" are still bitter that they can't "play

GOD" anymore with the PBBS system. I haven't figured out their
reasoning for opposing Internet-backboned systems so vehemately. I
suppose it is to show that they were "good Gods", and that we should
return to the "golden" days of HF message forwarding - which mainly was
a forum for selling old ham gear, and supporting high-speed Morse Code
requirements(due to the "slanted" view of "the Gods").

Sorry Ed, - I get sidetracked - I am putting out 100 watts per meters, and I replaced the sound card with one that had an external input.

no monthly fee, as the units only communicate with each other. If you have
two you can connect one to your internet PC and use it as a gateway so you
can run email and ICQ from another portable unit.

<horseshoestew@my-deja.com> wrote

> I need to take my company public.

No.

You need venture capital. To get that, you need a physical business plan. The vc guys will take you public when they are sure they will make a killing, and not one minute before.

Until then, you will have ample capital to both hire engineers and ramp-up a production base. This means a post-prototype device void of any patent infringement. They will usually hire a patent lawyer to check the fees, and finish out the business plan.

You need to find an economically depressed area to build the factory, as the city will be eligible for federal funds, and you will get zero property taxes for about 8 years.

Another good idea is to hire a full-blooded Indian woman to be the President, or at least an Hispanic woman, and this will be the only way to get a small-business loan. Indian women, make excellent executives and will be one of your best investments for the company.

Jimmy

P.S. You will normally have less than 51% ownership by the time you have all the capital you need.

I'm doing it right now - call the FCC.  If you keep bothering them with
non-issues, they'll probably pull YOUR ticket for being such a pest.
```

As long as you aren't conducting business over the Amateur frequencies,
and are using the channel for personal communications - it is legal.
Quit spreading false rumors - you aren't "God" anymore.

I checked out their site thoroughly. The problem is the range(or lack
of it). I've thought about getting a couple for my kids, and so I can
get ideas - but the range looks so sickly that it reminds me of those
old pre-FRS 49Mhz "walkie-talkies" that you couldn't talk to with
anyone 100 yards away outside, or in the next room! This kind of thing
could make it harder to sell more capable wireless PDAs in the future,
if people get the idea that the technology is bunk. This was an

```
initial problem with FRS(and still may be a problem to this day), as
people were hesitant to get "ripped off" with cheap walkie-
talkies "once again".  To be honest with you - FRS range STILL sucks -
but 1 mile is much better than 100yards.

You talked about development - at the site it just says "coming soon".
This just amounts to marketing hype at this point.  I've been working
on Palm PDA apps, got sick-and-tired of the GCC runaround, and now I'm
running CodeWarrior.  At least this is a "real" development
environment, and not vaporware.

Is it really your place to assume what should be this person's area of
interest?

I don't think so.

If you are allowing messages and content that do not meet the criteria
(As set by the FCC) for legal traffic, you are illegal.
If you are providing a service to others which is also available through
commercial providers, you are illegal.
If you encrypt your data, you are illegal.

You really need to READ part 97, and read it for content. The rules are in place for a reason. That reason is to keep guys like you from using the ham bands for commercial ventures.

I have nothing against the technology that you are proposing, provided it be used on a frequency band that is approved for that type of traffic.

Dave

The reason I only post infrequently on these newsgroups is the same one that is causing our great hobby to die out. I have been a ham for 17 years, and during that time I met many great people, but unfortunately, it is the "mouthy minority" who insist on putting in their uninformed opinions that makes us all look bad. Seek professional help. Find out why you think that "rolling your own" makes you superior, knowledgeable, or even qualified to make your statement. I spent many an hour making other ham's "roll your own" equipment operate. This does not make them stupid, as you infer that I am. If you haven't got anything constructive to say, then don't say anything. I asked for help - not snide remarks. Get a life.

>Is it really your place to assume what should be this person's area of
>interest?

>I don't think so.

I don't suggest that his area of interest is somehow wrong, I only agree with the advice that he should invite someone with more insight in this matter to fix it for him. I don't understand how this can be considered bad advice.

Once you have studied a simple schematic for keying a transmitter, and have soldered the few parts together, you usually know enough about it to know the limitations of the design, and what to do when the transmitter does not key or remains keyed all the time.

Same for the connection of soundcard output to a transmitter.

When someone considers it easier to buy a blackbox to perform these tasks and does not understand why it does not work, it is very difficult to diagnose the situation from a remote location and provide him with advise that would help him towards a working station. Someone should do some simple conductivity and level tests at his station, and deduce what is wrong.

Rob

More doublespeak. The rules are in place to disallow an individual to
conduct business on the ham bands. There are plenty of "commercial"
ventures on the ham bands - what do you think APRS is? What do you
think all those commercial radios are? You're talking out your ass.

> I have nothing against the technology that you are proposing, provided
> it be used on a frequency band that is approved for that type of
> traffic.

It IS OK for ham bands - because there ARE no other commercial services

that offer the same kind of functionality(there are no existing
services that provide equivalent range for mobile platforms). Besides,
if your reasoning held true - we would have to outlaw all ham phone
patches! Quit talking out your ass.

Now *I'm* baffled: how can you be a ham for 17 years and have
such difficulty figuring out these interconnections? Are the
makers of the hardware or software doing something wrong?
How can they do it better?

Simple - The supplied manual has a pinout that differs from my rig. The
version 2 manual on the supplied software shows a second, and the website
shows a third version. None of them seem to work. At first my soundcard
input connector was bad (I fixed it, so now I have a spare). Following the
manual doesn't produce any positive results, therefore I am inquiring if I
am mis-reading the manual. I have received a response from Rigblaster and
they are baffled as well. I was hoping to find someone who has encountered
this problem and would offer a solution. I have received a few great
responses, and they were greatly appreciated.

This guy has proved his point over and over again (that he's an ignorant, characterless dud) but finds it necessary to prove it over and over again. (sigh)

We all get the point, bud; You're an ignorant idiot. Now troll off and infest some other newsgroup.

They don't seem to have a monthly service as such. The Cybiko seems
to be a pure peer-to-peer system with the functionality of a PDA. The
company does offer games and downloads for the device.

If you read the brochure, it is careful to say (in kids' language)
that it can support 100 users (10 users per freq for 10 freqs.) There
is supposed to be an email gateway available, though it is strictly
local (basically, a Cybiko hooked to a PC with the software). Nothing
said about cost (if Cybiko provides it) or security. They do say the
gateway software will be available "soon" for regular users.

You must admit this isn't much of a limitation for its intended
use--kids in groups at the mall or the movies. (Or, horrors!, school.
Watch this be the next thing banned: its applications for exams are
much too obvious to note here)

I think it's a cool PDA that may find a closet audience with some
older people. I'd like to develop for it myself.

Thanks for reading my post. IF the HF doesn't bring my reserve, it will not be offered anytime soon.

If your the winning bidder, you will receive a beautiful General Coverage Rig, Mint cosmetically as well as electronically. Built-In Antenna Tuner, No Microphone. I do have a COPY of the owner's manual.

I try to personally check out each item I list for auction, and to describe each item completely & carefully. However, since most of these items are used electronic pieces all items are sold "AS-IS".

BUYER pays a flat rate of $30.00 for shipping insurance and handling.

This rig was checked out by a local LICENSED HAM TECHNICIAN in North Georgia, and found to be in EXCELLENT HEALTH (this was less than 3 months ago).

THIS HF RIG IS A RELISTING!! I LOWERED THE ORIGINAL RESERVE PRICE. With the RESERVE lowered to it's current price I am now cutting the rig over $500.00 from what I paid for the rig less than 3 years ago!

ADDED BONUS!! To the HIGH BIDDER & (who meets my reserve price)I am giving FREE a cable that connects the RIG to a IBM Compatible PC. You can "Control" The IC-737 via your computer!! This WAS NOT Included in the orginal offering.

To Bid On This Item, Please Click Here!
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=454010399

Please contact me for any further information ngwd@flash.net

Happy Bidding Good Luck! 73 Daniel KC4OXP

Then why aren't you checking the pinout as printed in the manual of your
rig?  Often it is printed in two places: one time in the general section
where it shows how you can connect your own stuff, and one time in the
schematic, where you can trace leads and derive their functionality.

One can assume that these pinouts are correct, the worst problem can be
that you don't know for sure if it is a view of the outside of the rig or
the front side of the plug.  But often there are pin numbers.

Are these "walkie talkie" things still popular in the states? Guys, you
are years behind! Over here in Europe all the schoolkids have a handheld
phone (GSM) and are sending short text messages to eachother when in places
where it is not clever to talk in the thing.

No range limitation, you can chat to your buddy whenever both of you are in
range of the mobile network. Which should be anytime, given the fact that
antenna forests are on each of the highest buildings of every block.

(some statistics show that there are more handhelds in this country than
there are private subscriber phonelines)

Hello.
A pointer to some group that talks about those cheap substitutes would be
nice. So far by what i'd seen this is the ng that talks about digital
comunications by radio (that's what i need, microwaves need line of sigth,
that is something that i don't have)
Luciano Almeida

Apparently you don't know what "amateur radio" is. It isn't the use of radio for purposes of any type of communication that would be more expensive when using commercial providers. It is the use of radio by people who want to experiment with electronics, propagation, etc. As a hobby, where the communication is a by-product, not the goal.

So no matter if we have the right solution for you in the amateur radio domain (which we really don't, but that is another matter), it would not be usable for you as you would not be able to operate them within the restrictions of amateur radio.

For cheap solutions, go to your computershop around the corner.
But I think they won't have anything as cheap as you want.

Rob

I'm often amazed with people who think radio links should be as cheap
as a $60 and have a bandwidth in the Mbps, and it will operate
through forests and mountains.

It will always be cheaper initially, to use a modem hooked-up to the
copper wire or cable that comes up to the house/office.

The cheapest system I can put together right now is about $500 a node
for new equipment. Maybe $400 if you have some old antennas from
the MDS TV system. But this will only go about 5 to 8 miles LOS.

But, if a cable modem costs $40 a month, or ISDN at $72 a month, you
can see where an RF link would pay for itself in less than a year.
Now the only problem, is finding an ISP within 5 miles of your link,
or putting up a 100 ft tower in the backyard :-)

It was amazing that one could transceive over RF too. Now that's history. Perhaps we need more of THIS kind of "ignorance".

Isn't it all about breaking down road blocks? Where are you going without a goal?

How about free, high bandwith wireless that also works over forests and mountains! Isn't this the real challenge in Ham radio? Are we going to continue to get stuck in our self-righteous letter of the law or are we going to INNOVATE? Perhaps the lawmakers (FCC) better get ready for change.

Sure FCC rules are important but mainly to stop the inconsiderate. Let us not lose the bands altogether while bickering about the finer points of Part 97 law.

>
> But, if a cable modem costs $40 a month, or ISDN at $72 a month, you
> can see where an RF link would pay for itself in less than a year.

Now you're thinking. No goal should fail to consider the cost effectivness of a technological benefit. If it isn't adopted is isn't used.

We need to ask ourselves what can airwaves do that coax can't.
We need to out-do or be happy working with wirelines.
We need bandwith in RF that can't be produced in coax or even fiber.
How? THAT is the challenge. That and the FCC. Dream big!

73

P.S. Special thanks to Ben Franklin, Tom Edison, Alex Bell, Marconi etc.

A moot point... Neither one has any place on the Ham bands. - Duh!

The amateur radio tcp/ip station located at Stanford University
(as of Sept. 1998) had radio/modem capable of sending over
50Kbaud over amateur radio. It may have been as high as 100 Kb,
with several people in the San Francisco area having similar
equipment.

I've been out of touch with them for a couple years... try finding
material on the Web on the Stanford U. amateur radio people; also,
one callsign i recall is n6oyu, though he did NOT himself have
the high-speed radio capability i am writing about here.

If i were living in the San Jose - Palo Alto - San Francisco
area right now and had the bucks to burn (over $500 for the radio
and $500 for the modem, they were saying), i would go for it.

Maybe other people reading this can help with this also. Also,
if it's for your personal, and not business or commercial use,
and doesn't violate other content restrictions, don't let anyone
tell you you can't do it on amateur radio.

sorry for asking...

So far what I have seen is all in the 1200 US$, both points. The ideia was to make the experiment. Not to save money (and a better letencies that in the internet). with the 200 bucks I can make about 400 h of comunications. but what was also important was doing something for myself. Also remember that cable modems and DSL aren't in all places. Where I live (ribamar, a small village in portugal, you may look in Encarta), DSL is a mirage and cable is only in major urban centers. The other node of the net wouldn't be an ISP (as I know, they don't have radio access to users). ISDN isn't a option (about $25+ the line plus the calls).

The call to the local computerstore also isn't valid, all i can find is home devices (2.4 ghz, most, and about 1/2 mile of range, at most, all about $300). As i know, the high range devices aren't available to the home user. The i had seen are to companies/ISP's that need to connect vital parts of bussines (and came with all the fuzz i can pass on, and a price tag that makes me angry, this without the no talk to a non pHD, nor bizz director of some multimillion dollar company).

I saw something in the range of amateur packet radio, i passed by the tapr.org site and saw some of the devices. what is stayed in my mind is that a radio is also needed. I WONDER if there is some company that make a radio coupled to one of the designs and put a TCP/IP protocol attached.

I'd also seen some projects that use proxim symphony cards or Orinoco http://www.xlan.org , http://www.gbonline.com/~multiplx/wireless/ and someones http://www.radio-link.net/link.html)and put a microwave antenna into it. Because i don't have LOS (almost, but not quite), I don't have confidance to place $300-400 in some cards and antennas that can became uselless. Radio would be fine, because it matches my needs, is fast (about 300.000km/s), can travel trhou the hill and i don't need a megabit connection (56kbps is just great). Now what I didn't expected is to have to design a way to put the output of the modem to the phone line in the air (maybe some IF circuitry to put the about 10 kHz of the phone line is about 300-500 Mhz, remember to check what are the ones free here, the computer modem takes care of putting the computer connection in analog) and make the oposite thing in the other side of the carrier. Don't tell me that you were expecting me to go into university and need to share some works and do work with someone that is apart (without the need to pickup the car and spend fossil fuel, that now is almost $2 per liter here) from here to have this ideia (the packet radio is older than i am, some of you maybe are as old I expect to be someday).

And ISDN (here called RDIS), is known some interface between those boards and radio adapters?

I'd spoke.
Luciano Almeida

BTW, great page Steve.

You mean I can't tell someone I just got an email about "Hot Ladies"?
Of course I can tell them that.

Sure, but the original post, like so many in this newsgroup, had
nothing to do with amateur radio. It was a commercial posting:
"I'm too cheap to pay for a network and have some notion
that amateur radio may provide a cheap substitute". Which is
nonsense...

Sure you can - because it is neither the porno itself OR an advertisement
for the same.

Try to stay focused, and on-topic.

The porno AND the advertisements are all over the Internet, and have no
place on the Ham bands.

The morons who keep insisting on using Ham Radio for casual Internet access
are also the same morons who keep insisting the rules be changed to allow
everything you might find there. - Including advertisements the Internet is
chock-full of, including ads for porno. Commercial advertisements do not
belong on the Ham bands. Period.

Are you sure I was talking about porn?

Nobody ever suggested they be transmitted on ham radio.
It is trivial to avoid doing so.

Right. The internet is a terribly dangerous place! One must be ever vigilent
else one
might *open* an email that said "Hot Ladies" in it's subject! And then one
never
knows what one might find! Oh oh! Danger Will Robinson!

Is it really nonsense that people would feel that they could turn to Amateur
Radio for answers to the original question? Is not Amateur Radio promoted
as a public service? What better public service than to answer questions
from the public about an area you are involved in? Perhaps Luciano assumed
that some of the people in this group might be involved in the manufacture
of commerical products, or, being knowledgeable about digital radio, might

know about commercial products that would fit his need. Maybe he did, or didn't know, that Amateur Radio couldn't be used for his specific purpose, but I think it a natural to assume that a Service that promotes itself as knowledgeble and helpful would be a good place to get some knowledgeable answers. If he had any misunderstandings about the appropriate use of ham radio, I am sure he would have understood quickly once it was explained to him. If his interest extended past just getting the message across into an interest in things digital, it is entirely possible he might be interested in being a ham himself.

Icom IC-737 Mint Condition.

If your the winning bidder, you will receive a beautiful General Coverage Rig, Mint cosmetically as well as electronically. Built-In Antenna Tuner, No Microphone. I do have a COPY of the owner's manual.

I try to personally check out each item I list for auction, and to describe each item completely & carefully. However, since most of these items are used electronic pieces all items are sold "AS-IS".

BUYER pays a flat rate of $30.00 for shipping insurance and handling.

This rig was checked out by a local LICENSED HAM TECHNICIAN in North Georgia, and found to be in EXCELLENT HEALTH (this was less than 3 months ago).

THIS HF RIG IS A RELISTING!! I LOWERED THE ORIGINAL RESERVE PRICE. With the RESERVE lowered to it's current price I am now cutting the rig over $500.00 from what I paid for the rig less than 3 years ago!

ADDED BONUS!! To the HIGH BIDDER & (who meets my reserve price)I am giving FREE a cable that connects the RIG to a IBM Compatible PC. You can "Control" The IC-737 via your computer!! This WAS NOT Included in the orginal offering.

To Bid On This Item, Please Click Here!
http://cgi.ebay.com/aw-cgi/eBayISAPI.dll?ViewItem&item=454010399

Please contact me for any further information ngwd@flash.net

Happy Bidding Good Luck! 73 Daniel KC4OXP

> sorry for asking...
> So far what I have seen is all in the 1200 US$, both points

To do 56Kbps, in the environment you describe, that's about right. A VHF WA4DSY/transverter setup at about $700/site(including shipping to Portugal) would probably work in your situation.

But to be sure, I'd have to see the hills and the two sights to tell you if it would work. Here in the USA we have topograhic maps that can be used to do a sight-unseen analysis, as well. Even Worldwide Level 0 DTED(freely available for downloading on the Internet) can sometimes be of some use. If you give me the precise lat/longs of the two stations, I could give it a look.

If you are willing to drop down to 19200 or 9600bps, AND the terrain allows a UHF link, you might be able to get the costs down to about $600 total - two TEKK data radios(about $190/ea), UHF directional antennas($100/ea), and some YAM 9k6 modem kits($20/ea). Getting your antennas/radios up on a tower can help to greatly extend your range on UHF - but of course the costs begin to climb again - and if you can't get your radio mounted on the tower, your transmission line costs start to really add up on UHF(you need to use high-quality low-loss coax at these frequencies) - so you are starting to look at $1200 again, if you have to battle to acheive RF LOS! If you need more power than the TEKKS put out - you can go to Kantronics D4-10 10W UHF radios - but now your possibly looking at up to $1700!

So, you see, this is why we just end up flaming each other here - hardly anybody here is in a situation where he/she needs to set up a station like you describe(I actually am - I'm working on setting up a link from San Diego to Rosarito, MX - thru rolling 150' hills, over 25 miles). And for those who do want a setup like you describe - they can't afford the time and/or expense to do it.

It is VERY cheap and easy to do 50 mile VHF radio links at 1200bps - the problem is that is TOO SLOW to do most modern applications. APRS is an exception. Cheap access to E-mail/newsgroups/chat/stock quotes/etc. from a mobile laptop/PDA might be another - but then you would run into the hams that would protest even this.... That is why I'm eventually going to be moving my 1200bps mobile applications to MURS (a new VHF radio service in the US that allows both digital and commercial content).

Oh, and I tend to agree with the "Helpfull" and "O.C."'s attitude. If you're not interfering with anybody else - just go ahead and use the ham frequencies to set up personal low-cost high-speed RF Internet access links - the FCC gives us no other choice(MURS won't work at more than 1200bps, as there aren't any companies making VHF 9k6 data radios). Save for a few high-profile repeaters, the VHF/UHF ham frequencies are basically unused. If enough hams start doing it, the FCC will probably just change the rules to allow it, or start another service that will allow it. The public are being FOOLS for paying huge initial equipment costs, and $40/month for wireless Internet service.

Thank you for your answer.
Maybe it's the answer that i was looking for since the beginning.
So far I decided to delay the link for a while. Phone line so far is working
and the connection only need about 1-2h daily.
Maybe sometime I will go for the radio solution (when i will have a real
job).
thanks again for your help.
btw, station 1 @ 39�00'20"N 9�24'16"W
station 2 @ 38�58'10"N 9�22'30"W
and, btw, i have some interest in ham. I'd been at a local fire department
(as volunteer) and i like the radio and comunications and all kind of stuff

Now is the time to dust of that DSP-12 which is sitting on your shelf and prepare for the upcoming launch of P3D, because here is some good news for all you DSP-12 owners:

I have uploaded a modified version of the 400 Bd PSK modem for the DSP-12 to the following URL:
ftp://ftp.tapr.org/dsp/Motorola/dsp56001/dsp-12.

The modification consists of a change to the software so that it sends 514 bytes rather than 512 to the listening program. In this way also the CRC bytes will get transmitted to the listening program.

The modified modem has been tested by Stacey Mills, W4SM, and he has this to say about the modem:

"I burned the new eproms and checked out the 400 baud PSK demodulator with 514 byte capacity. It works very well... Actually, very, very well. In fact, doing some tests with some 400 baud PSK wave files that I have generated, having a calibrated background noise, the DSP-12 functioned as well or better than any other modem I have tested"

The file gce201.zip contains these files:

READ.ME
GCE.V40 - Executable that may be downloaded to the DSP-12
GCE.B - PROM image for the B-PROM. Checksum: $1900
GCE.D - PROM image for the D-PROM. Checksum: $5000
GCE.F - PROM image for the F-PROM. Checksum: $4900

Have fun.

Ooh, I'm interested in this. Is there, like, a standard program
that people use to do this kind of thing? Can you get the data
for free, and what kind of work is required to do this. That is for me
to figure out whether two points on the map are line of site, without
leaving
my computer desk here. Is there a web site or book that describes
how to do this?

Really, I thought they were just running 9600 baud on Tekks.
If they're doing 56K, I'm very interested. I think I have
a line of site path to some of the higher hills in Palo Alto
from here in Berkeley.

DTV is the system this country will be using exclusively by 2006. Many stations
have already started transmitting it. This is the over the air example of MPEG
compressed live digital video that we have available as a model. As such,
understanding its parameters and limitations is relevant to the current discussion
of amateur digital TV transmission.

You can't do it on a PC because the data rates are much too high to be handled by a PC. Even with SDTV, we're talking about 300 Mbits per second in the raw video stream. The compression algorithms require *much* more than a single clock cycle to execute, so a 400 MHz PC is much too slow, even the soon to ship 1 GHz CPUs are too slow, not to mention that the bus speeds of PCs are too slow to keep the data streaming in and out of the PC without bottlenecking. The commercial Harris MPEG encoder we use has a massively parallel architecture using custom bit slice chips to handle it. It occupies half of a 6 foot relay rack and requires 20 amps at 220 VAC for power. That's the state of the art today for MPEG compressed live video. (It actually runs one full frame behind realtime.)

Decoding MPEG is a much easier task, but the PC still can't handle a full rate SDTV signal. It takes a custom chipset to do it. The PC can decode a sharply rate reduced signal, but that isn't full TV resolution, size, or frame rate.

>I'll let the 100,000 thing you said stand, but no, I don't personally

I'm talking about standard live action full motion full resolution video of the sort we've been delivering to the home for 50 years using analog NTSC broadcasts. Now if you are talking about sharply reduced rate video that's post-processed out of realtime, then that's a different story. Strongly rate reduced video can be MPEG compressed on a PC, not in realtime, but at a multiple that's only about 10:1 behind realtime. For preproduced video segments, that's tenable, but it isn't live TV. We do that too in broadcast. We can post-process 30 seconds of video in 5 minutes using a normal PC architecture. That's fine for commercials and other short segments that we can prepare in advance. But we can't do that for realtime live video with a PC.

>avialable software.

We can fit an analog SSTV signal into a SSB bandwidth today. In fact it is done every day over the air on 14.230 MHz. We could do it digitally in a FM voice channel bandwidth today too. In fact we do that, transmitting digital pictures by packet. Doing it at 8 seconds per video frame on the current low speed packet links is another story, of course.

Even MPEG compressed, there's a lot more data bandwidth required than when transmitting the picture in analog form. It takes a minimum of 8 bits per sample to convey the luminance information in a single analog video level, and you have to repeat that for every sample of the video line that you send. With standard TV resolution of 640x480, and a frame rate of 60 per second, that's 145.7 Mbit/sec. For slowscan we reduce that to 120x120 and a frame rate of 1 per 8 seconds, so we only have 14,400 bits/sec. But that's only for B&W pictures, if you want color, you have to multiply everything by 3.

Depending on picture content and motion, MPEG can reduce that by a factor of between 2 and 4 (more if you'll allow some fairly gross artifacts due to lossy compression, you've seen those artifacts if you've watched streaming video over a dial up internet connection). But you're still talking a substantial signal bandwidth. There's no significant over the air bandwidth savings with binary modulations. With multilevel modulations, like 8VSB, we can shrink the signal down to about what we would need to transmit analog video signals. We can't do that through an ordinary FM voice radio, though. We'd need a purpose designed RF modem.

Remember that we can't use the bandwidth compression tricks used by phone line modems over the air. The nature of the medium is different, and those techniques don't work. We have a multipath riddled channel, often with a marginal SNR, laden with interference and contention that the phone line methods don't have to face. So we have to use more robust modulations, and those occupy a greater bandwidth, or take longer to transmit.

There are advantages to transmitting video digitally. Otherwise we wouldn't be spending better than $50 million per broadcast station to convert over to do it. But you aren't going to get full resolution full motion video in bandwidths that would be acceptable for use at amateur frequencies below 70 cm. Most amateurs are unlikely to expend the necessary funds and efforts to do DTV on 70 cm when they can already do analog TV there with simple equipment.

SSTV may be another matter. The digital advantages against noise and interference may be sufficient to cause amateurs to make an effort in that direction. But MPEG compression is hardly needed for slow scan. The data rates are already low enough to be used on ordinary radio channels, and the pictures are already so crude that further artifacts due to compression would likely make them unacceptable.

You can do what you want, but not for that price. The best deal I've seen is the Surfnet frequency hopping modems at $300 each. This is a complete turnkey package. You'd need 3, one at each end of the link, and a third to act as a relay node at a point mutually visible to the others. I know from experience that these modems can achieve a 28 mile line of sight range, though they only claim a 5 km range. But they won't work very well over an obstructed path. You will have to engineer the path to be line of sight by installing a mutually visible

```
relay node.

I know that's more than you wanted to spend, but these modems
do 115 kb bidirectional, and don't require a license to operate.

You ignored the comment about handheld digital camcorders...
Sure the quality is less than broadcast standard, but they aren't that bad
either. They are *a lot* better than anything I have seen done in software
on a PC, for sure.
How are these beasties ticking? The compress in realtime for sure, the
recorder would not be able to store the live video without compressing it
first (due to the bitrate limitation you mention).

Well, the general level of discourse would be improved if everyone
did read QEX, but now that I've read the article, the URL is:
http://www.tiac.net/users/reilly/los_form.html

It turns out, the site accepts a request, runs the data in a batch and
emails the response to you "within a day or two", as an attachment.

So are dollars - which is why I cannot get a fast packet modem at present.
The kits sell for around $270US (not including the relevant transverters).
This would be just feasable for me if it was Australian dollars but since
the US is the only country doing well in the world our dollar has dropped so
these modems would cost about $500 Australian.

I was recently looking at the WinRadio Universal FSK decoder software:

http://www.winradio.com/home/fskdecoder.htm

Evidently, this works with any SB sound card. Unfortunately, it costs
about $400.

Does anyone know of any similar software at lower cost?

You could buy the software + maps from Delorme for
about $29.95 (what I paid for the Western US version).

Does a lot of things, including path profiles, and nice graphics.

I am only responding to this post to point out that above (drug
induced) so called logic is misleading as follows.

You might say an airplane can't fly because the laws of gravity or
physics will not allow it. This was the belief. Not to mention the
sound barrier. Now these amazing feats would appear as magic and
unbeleivable to our nay saying forfathers. Yet those who innovate with
God given creativity have worked with laws of physics to overcome.

So where is innovation in radio that would solve our problem and
provide needed benefits?

"Nesesity is the mother of invention"

Edision failed repeatedly until he'd invented the Light Bulb. It is
interesting to note (now that I consider it) this too had to account
for practicality, logevity and cost effectivness.

Never give up on a good goal! (That's by me) :)

73

P.S. First we must define the problem. What are the needed benefits
wirless RF could provide if there were no limits?

HERE, HERE! I agree with this. This is what I'm saying. I hope you
people read this. I hope you get the point. I hope all hams consider
this wisdom as to the "rules". let's show them what Hams are made of!
Don't you know if we could start providing some real benifits (both on
or off the Ham bands) people would take notice? What could be better
for Ham radio's future?

Hello.
Me again....
Do you have a link? So far I was unable to find the site...
And US$300 by node, is portuguese economy is quite a lot, but i may give a
try... right now is't about 60.000$00 (PT Escudos), or almost the national
minimum wage, but hell, let's give it a try.

Hello, fellow PSK31 operators,

anybody interested in experimenting with PSK31 on 50.290 in the Boston area?
It is a shame that 6 meters are mostly crowded only during voice contests
few times a year or in occasion of big propagation openings.

If you would like to give it a try, please reply to this posting or e-mail
me at N1XOI@arrl.net I can be on the air during weekends or late evening on
weekdays. Thanks!

Paolo, N1XOI.

I found that a call to the FCC's enforcement division put a fast stop to illegal activity in the north Texas packet network. If you see any of these morons willfully breaking the regs, give the FCC a call. They will rapidly discover a new respect for the regs, and their fellow Hams.

These concepts were not pioneered in Amateur Radio. First off, the position measurement system (GPS) was developed by the Government. Businesses and police departments have been transmitting position information via radio for years. Before there was GPS they were doing it with Loran C. Almost 20 years ago I was working on a project where we transmitted Loran C positions back to a central dispatcher via a VHF communications system and displayed the vehicle's position on a computerized map. The only way it was related to Amateur Radio was that we happened to have a couple of hams working there.

What I think is slightly interesting is the whole patent issue. That is that with all
the patents flying around, that amateur activity might establish
some prior art for some of the stupider ones. Like isn't there a patent that
basically covers any wireless device hooked to the internet?

Also, even the cell phone guys come up against expectations that wireless is
going to be easier to do than it really is. Because my understanding is that something
like WOP or the systems that talk to the wireless Palms and things aren't
hugely far ahead in bandwidth of what ham radio connections are at.   Radio harder
than wires. Really.

If you want a real example, look into the military use of automatically
configured cooperative networking. This is a spin-off of ham radio
networking. But we're talking 1986 here ... nothing new since.

> And we don't have access to equipment and laboratories? Bull!!! Most
> laboratories are probably run by Amateur operators. Equipment? When we can't

> when it's the rest of the world that we are trying to help. Where would

> Amateur Radio be if we didn't do phone patches? Where would Amateur Radio be
> if it didn't use power from the commercial mains?

Where would emergency communications be if we were always forced
to use nothing but commercial power?

> It's a pretty impressive thing to see two field day operators talking to
> each other during a disaster. Yep, two stations that can pass messages. But
> to whom? You have to interface to the rest of the world. You can't create
> islands.

Um ... you miss the entire point. The emergency creates the islands.
Ham radio bridges them back together. That's the whole point.
Stop thinking "bypass ham radio over the internet" and start thinking
"bypass broken internet access over ham radio."

> To rely on the Internet completely is just as dumb,

But this is EXACTLY what the Land Line Lids have forced on the US
ham radio networks. They're dead Jim.

> BUT, as you so
> eloquently put it, sometimes we just can't compete with the dollars of big

Oh really?
Our job is to provide communications when those commercial
links ARE NOT WORKING.
Understand now?

> Remember that Arpanet/Internet was created as a disaster resistant
> network with a lot of our tax dollars. Their is more routing redundancy in
> the Internet then probably any other network, including the telephone
> network.

Baloney.
Go read the history of Arpanet.
Think just a little bit about the telephone network. Do some math.

I like digital modes also. But...

One problem which explains why those have had little effect on ham radio.
Ham radio has not progressed in digital data transfer since about 1985. For the most part in the U.S. we are stuck on 1200bits/sec. Yes, 1.2kBIT/sec.
Sometimes 2.4kbit/second. A few have 9.6kbit, and a very few have 56kbit.
You have almost no choice in 9.6kbit equipment, and for 56kbit or faster you have to build your own, or buy commercial (i.e. not ham band) wireless gear.

So that's about it... Until high data rate digital transmission becomes the norm, there is just no bandwidth for digital voice, much less digital video.

I'd actually like to work with some higher power 2.4ghz gear (bandwidth there does 1mbit and more), but I'm not up to building my own from scratch (kit if no exacting alignment I could do). So I pretty much have to stick with commercial stuff, and maybe an amp. But I have nobody within range to experiment with, and I can't leave it running unattended, because it has to have automatic transmit power control... Oh well, maybe someday.

HOW TO TURN SIX DOLLARS INTO SIX THOUSAND DOLLARS: Below is a testimony, written by Terry Thornton..

I found this on a bulletin board and decided to try it. A little while back, I was browsing through newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of 6.00! So I thought, "Yeah right, this must be a scam", but like most of us, I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it. So after thinking it over, and talking to a few people first, I thought about trying it. I figured: "what have I got to lose except 6 stamps and $6.00, right?" Then I invested the measly $6.00. Well GUESS WHAT!?... within 7 days, I started getting money in the mail! I was shocked! I figured it would end soon, but the money just kept coming in. In my first week, I made about $25.00. By the end of the second week I had made a total of over $1,000.00! In the third week I had over 10,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more than that on the lottery!! Let me tell you how this works and most importantly, WHY it works... Also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. I promise you that if you follow the directions exactly, that you will start making more money than you thought possible by doing something so easy! Suggestion: Read this entire message carefully! (print it out or download it.) Follow the simple directions and watch the money come in! It's easy. It's legal. And, your investment is only $6.00 (Plus postage) IMPORTANT: This is not a rip-off; it is not indecent; it is not illegal; and it is 99% no risk - it really works! If all of the following instructions are adhered to, you will receive extraordinary dividends. PLEASE NOTE: Please follow these directions EXACTLY, and $50,000 or more can be yours in 20 to 60 days. This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions. You will now become part of the Mail Order business. In this business your product is not solid and tangible, it's a service. You are in the business of developing Mailing Lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from the mailing lists is secondary to the income which is made from people like you and me asking to be included in that list. Here are the easy steps to success:
STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope (to prevent thievery). Next, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a $1.00 bill. What you are doing is creating a service. THIS IS ABSOLUTELY

LEGAL! You are requesting a legitimate service and you are paying for it! Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal. Mail the 6 envelopes to the following addresses:

#1) B. Carlson 302 University ave. NE, Minneapolis MN, 55413

#2) J. Henkel 131 Cedar Grove Ave. New London CT 06320

#3) Carlos 1652 W. Gardena Blvd., Gardena,CA 90247

#4) A. Graham 302 W. 5th St.; Fulton, MO 65251

#5) G. C. Acker P.O. Box 29116, 7001 Mumford Rd. Halifax N.S. Canada B3L 4T8

#6) L.Wilson 332 N. Westridge Ave. Covina CA 91724

STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as number 6 on the list.
STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there are close to 24,000 groups) All you need is 200, but remember, the more you post, the more money you make! You won't get very much unless you post like crazy. :) This is perfectly legal! If you have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal lottery laws. Keep a copy of these steps for yourself and, whenever you need money, you can use it again, and again. PLEASE REMEMBER that this program remains successful because of the honesty and integrity of the participants and by their carefully adhering to the directions. Look at it this way. If you are of integrity, the program will continue and the money that so many others have received will come your way. NOTE: You may want to retain every name and address sent to you, either on a computer or hard copy and keep the notes people send you. This VERIFIES that you are truly providing a service. (Also, it might be a good idea to wrap the $1 bill in dark paper to reduce the risk of mail theft.) So, as each post is downloaded and the directions carefully followed, six members will be reimbursed for their participation as a List Developer with one dollar each. Your name will move up the list geometrically so that when your name reaches the #1 position you will be receiving thousands of dollars in CASH!!! What an opportunity for only $6.00 ($1.00 for each of the first six people listed above) Send it now, add your own name to the list and you're in business! ---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS------------ Step 1) You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and drag your cursor to the bottom of this document, and select 'copy' from the edit menu. This will copy the entire letter into the computer's memory. Step 2) Open a blank 'notepad' file and place your cursor at the top of the blank page. From the 'edit' menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name to the list. Step 3) Save your new notepad file as a .txt

file. If you want to do your postings in different settings, you'll always have this file to go back to. Step 4) Use Netscape or Internet explorer and try searching for various newsgroups (on-line forums, message boards, chat sites, discussions.) Step 5) Visit these message boards and post this article as a new message by highlighting the text of this letter and selecting paste from the edit menu. Fill in the Subject, this will be the header that everyone sees as they scroll through the list of postings in a particular group, click the post message button. You're done with your first one! Congratulations...THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup! **REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT : YOU HAVE TO POST A MINIMUM OF 200** That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O.Box due to the large amount of mail you will receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.** Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make an additional $625.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies, that just made me 3,125.00!!! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625,00! With an original investment of only $6.00! AMAZING! When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is: do you realize that thousands of people all over the world are
joining the internet and reading these articles everyday?, JUST LIKE YOU are now!! So, can you afford $6.00 and see if it really works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual internet. Remember, play FAIRLY and HONESTLY and this will really work !!

If you only saw doom 'n gloom in my post, then I must assume that you have allowed yourself to be hoodwinked into thinking that Hams should or could "compete" in the baud rate race.

You should be thanking me for the dose of reality. It is only when you have left your misconceptions behind that true progress becomes possible.

Yeah, some people are working on it. We did digital voice here back in 1990, high fidelity at 56 kb in a 100 kHz channel. Since then there has been much progress with codecs to the point where the required data rates for toll grade speech have fallen 10 fold. That takes it out of the special RF modem range and down into the range where the digital signal can be crammed through an ordinary FM voice grade radio occupying a 15 kHz channel. But guess what, we've been putting toll quality speech through voice grade FM radios for over half a century. Nothing new here. No savings in occupied bandwidth, little or no improvement in range. Etc.

Now if the average amateur didn't insist on doing digital through his Yaekencom FM voice radio, we could build special RF modems that would occupy less bandwidth than a FM analog voice signal. We could squeeze it into as little as 600 Hz of occupied bandwidth. But don't hold your breath waiting for that to happen. It has as little chance as the widespread adoption of the 56 kb MSK RF modem we've had available since 1989. Most amateurs won't buy it if it doesn't come from Japan ready to plug and play (and the plugs better be prewired, see Rigblaster).

Now there are some real benefits to digitized voice. We can route it, for example, over a digital network to give us linked systems such as we never dreamed were possible a few years ago. We can use FEC to push it through noisy links. Etc. But the chance that it will conserve occupied bandwidth is practically nil. Amateurs will still be using voice grade FM radios to carry the digital audio signals. (Hell, people are actually running PSK31 through voice grade FM radios on VHF. That makes a 31 Hz wide signal tie up a 15 kHz channel.)

Digital TV, well understand that the HDTV signal has a data rate of 1.2 Gbit/sec. Even at microwave that's a stretch. We're using GPS synchronized external clocking in order to try to fit it into current 40 MHz STL channel allocations to get it out to the transmitter site. (Removing the clock signal lets us stuff the data bits more tightly.)

Compressing it with MPEG and then modulating it 8VSB can fit it into a 6 MHz channel. That's the system broadcasters are moving toward right now. But that on the fly MPEG conversion requires a rack full of equipment that costs over $100,000. (Doing the reverse conversion from MPEG back to straight video is a much easier task, fortunately, or DTV receivers would be totally out of reach of the average viewer.)

SDTV has one fourth the data rate, but the on the fly MPEG converter still costs $100,000, and 8VSB still occupies 6 MHz even if we're only using it at one fourth capacity. So there's no occupied spectrum savings there either. We already have analog SDTV in a 6 MHz bandwidth.

If we were to rate reduce 8VSB, we could fit a SDTV signal in 1.5 MHz. That's still too wide for any amateur band below 70 cm, and we're already doing ATV on 70 cm. We could have more channels there it is true, but to do it we'd have to have special equipment at both ends of the link.

Today, a cable tuner and ordinary TV can be used to receive ATV. With this special signal, not even the new DTV receivers would be able to decode it (because it is running at a different rate than they are designed to decode). We'd have to build everything ourselves all the way to the CRT. Is that likely to happen in anything like a large scale way in the amateur community?

Having observed amateurs for 35 years, I think not. If it can't be added as a simple accessory to their analog radios, they aren't going to do it.

I'm sorry to be so down here, but this is the reality we've been facing in digital amateur radio. Enough people won't get off the dime to let anything better than what we've been doing for the last 20 years achieve a critical mass unless it is a pure plug and play that they can use with their existing Japanese analog radios.

We aren't radio amateurs anymore, we're just radio users, not much different from CBers. Even Hank and Charles, who moan so much, are just radio users, stuffing bits through their Japanese radios instead of through a Taiwanese telephone modem. If they started building and using high performance RF modems, then they might be able to say that they're putting the radio back into radio amateur.

Smelt your own copper too Gary? Roll your own sheet metal?

Some of us have interests other than building the low level
bits and pieces of the internals of things. Been there, done that.

Thousands of Hams cooperated to build the AX25 packet network and HF
forwarding nets that the tcpip goons showed such intolerance about and
actively worked to undercut. - So your "theory" does not hold water.

You are just indulging in some of the very behavior I described...

"The constant insults and accusations directed against the general Ham
community didn't go over too well, either."

I guess that sort of behavior is so deeply ingrained that it has become a
"knee jerk" or just plain "jerk" reaction by tcpip buffs such as yourself.

Thank you for the direct verification of my opinion. It's nice to be proved
right.

Hank, you just missed my point. My point is that to provide adequate emergency communications, we have to be prepared to use all methods available to us. Even if it comes down to flying homing pigeons back and forth. but I guess that does put us at odds with one another. If a person is laying on the ground dieing, I will try to help them using any means possible. I'm assuming that you will help only if you can use a radio to do so.

No Hank, that's only the way that you think things are. Even if the Internet passes all of the messages before you can do so, isn't just exchanging the BIDS and MIDS with your other radio stations showing that the network works? And if the Internet connections go down, wouldn't the traffic automatically start being carried on the RF links?

>

> Understand now?

Jeesh, I'm beginning to think that you paid someome to put your name on some
software, it certainly doesn't seem as if there is any logic behind your
thinking anymore.

The point is that if we depend ONLY on emergency power, we couldn't get our
job done. How often does your station run on emergency power? 0.001% of the
year? If that much? Just because we don't primarily rely on generators,
batteries, and other alternative power sources doesn't mean that we can't
use them when we need to.

The analogy between power and the Internet are similar. During "normal"
times we can use the cheapest, best performing network. During "emergency"
times we use alternative networks. Power companies and the Internet during
normal times, Generators and RF during other times. Why does this make the
Internet a bad thing?

>

No Baloney, just Hank.

Yes, the Arpanet was created as a disaster resitent network with many
circuit being highly protected and highly redundant. It was started back
during the cold war. Thinking of the telephone network, I don't believe that
there has EVER been a nationwide outage, especially in recent years. Even
during disasters, there have been many areas that have had significant
amounts of service. And in those areas where service wasn't available,
seldom have you had to go over 50 miles to find reliable service. But even
when portions of the telephone network goes down, that doesn't mean that the

Internet is down. First, there are many locations that don't use dial-up connections. They use dedicated circuits which bypass a lot of telephone network. Even ADSL is split off of the cable before it hits the switch. You don't get the overloading effect that you have on the telephone. And it's usually not the failure of service during a disaster, it's an increased capacity requirement that causes most of the problems. Not anywhere near as big of an issue on the Internet circuits.
And there's a good number of businesses that use satellite of microwave to get their Internet connections. Maybe a little rain fade, maybe a dish needs realigning.

No, I'm not saying through away radio. No, I'm not saying use the Internet exclusively. What I am saying is that we should combine the networks and use the best of both.

Ummm, you might want to go back and read my original message. It was about how mpeg and similar technologies might allow a lowered scan rate

TV to be used on lower frequencies.
I don't know what the hell you are talking about with "competing" with
commercial organizations. I don't see how staying with SSB and slow-scan
instead of using some off the shelf mpeg software or hardware is keeping
the ham hobby somehow "pure" of commercial interests. Based on that idea,
then you should be assembling your own transistors, since those are
commercial as well.

Hardly missed your point!
Please read what I write.
Perhaps even try responding to the questions.
Try to keep focused on ham radio, what it can or should do.

> > > It's a pretty impressive thing to see two field day operators talking to

> use them when we need to.

Where did I write "ONLY"?

The truth is that my station tends to be run about 1% of the time on emergency
power during the usual year. Some years a bit more, some years a bit less.
Sometimes when I'm on emergency power there is no telephone service,
sometimes there is no telephone service but there is power. Depends on
exactly what fell down, blew down, or was knocked down by some pickup
going off the road. There has always been working cell service though, so I
should rely on it and forget ham radio according to your argument.

> The analogy between power and the Internet are similar. During "normal"

There are no longer any alternative networks.
The Land Line Lids killed them off.
They ain't there. We can't use them.

> during the cold war.

You are confusing MILNET with ARPANET. Read the history.

> Thinking of the telephone network, I don't believe that
> there has EVER been a nationwide outage, especially in recent years.

So what? Straw man. You didn't do the math to support your claim.

> Even
> during disasters, there have been many areas that have had significant
> amounts of service.

And many areas that had no service at all. Ignore them?

> And in those areas where service wasn't available,
> seldom have you had to go over 50 miles to find reliable service.

And areas where you did have to go over 50 miles. Ignore them?

> But even
> when portions of the telephone network goes down, that doesn't mean that the
> Internet is down.

And services which only use dialup, leased lines, xDSL, ISDN. Ignore them?

> First, there are many locations that don't use dial-up

And when it is a failure of service you ignore that?

> it's an increased
> capacity requirement that causes most of the problems.

And so we don't need emergency communications?

> Not anywhere near as
> big of an issue on the Internet circuits.

Ok, I'm convinced!

There is no longer any need for hams to prepare
for, or take part in, emergency communications.

> And there's a good number of businesses that use satellite of microwave to

> the best of both.

No disagreement at all.
But that is not what hams did.
They threw away the radio networks, and placed total reliance on the internet.

Is that a legal limit, or a technology limit ?
My understanding is that you can seek specific licences for experimental work
in the ham bands, and that such demonstrated experimental work is what leads
to new modes being put into the rules.

Well, I am not a ham, as stated before. Most of the guys I have worked with over
the years were hams because they liked to build their own equipment and
tinker.
I assume someone must be of that mindset, since someone started packet radio.

The correct statement is "tens of thousands of hams worldwide."
The growth was pretty fast in the late '85 - '88 time frame.
Peaked at roughly 55,000 hams and over 5,000 servers.
I'm sure we will hear from the anti-ham folks:
  "Oh no, it never happened, blah blah ..."

> You are just indulging in some of the very behavior I described...

There is an awful lot of "anti-ham" opinion out there.
Tends to discourage the newcomers.
Many have told me this.

No, I would not be for HDTV/HAM, or understand the point thereof. I was thinking more about slow scan and standard TV. HDTV is about what you can do with the present 6mhz bandwidth, which is too much for most hams, since that has worked with broadcasters by finding the nearest high mountain, not a very ham friendly mode.

> Compressing it with MPEG and then modulating it 8VSB can fit it

>

I disagree. Mpeg is compressable and expandable by an intel cpu. Now I know
that mpeg is simpler to expand than to compress, but 400 mhz chips can
expand quite well, and we are headed north of 1ghz.
I'll let the 100,000 thing you said stand, but no, I don't personally
beleive that either. Mpeg 1 and mpeg 2 chipsets exist, and are being
interated with handheld cameras now. I think you are talking about
studio equipment.

>

I think that the first target is slow scan or similar. Mpeg-1 technology
is considered old now, but that would be adequate for ham use. Further,
the number of frames per second and total resolution could be jiggered
downwards. My personal target would be a lowered resolution, lowered rate
signal in the bandwidth occupied by a FM voice signal. This would be well
within the compression capabilities of current CPUs running openly
avialable software.

> Having observed amateurs for 35 years, I think not. If it can't be added
> as a simple accessory to their analog radios, they aren't going to do it.
>

I yea, I am aware there are two kinds of hams, those that do, and those
that don't. I don't think it particularly matters, since those that don't
pay a lot for their hobby, and eventually buy from the do's (like packet
radio).

I agree in general, but I don't think I would bother saying "anymore".
The same complaint existed when I first read about ham in the 1970's.
I'm betting that you could find the same thing printed about the 1960's,
1950's and 1940's.

At one point there was a software that would run with the PK900 to provide
ACARS reception, as the decoder was buuilt in.
Anyone remember what that was??

Let's be honest here.

You seem to claim (in multiple postings) that this network was killed by internet forwarding of packet radio bulletins.

I claim that the decline of the packet radio network was due to direct internet access by licensed amateur radio operators. i.e. these messages were never transported by amateur radio means neither locally nor through any packet radio link chains.

Over here, it has been legal to tunnel packet radio messages using public telecommunication networks between amateur subnets since 1997, but the packet radio network had declined long before that. The only form of packet radio network that is working well and there seems to be an interest of maintaining it is the DX-cluster network. The maintainers are often keen HF-DXers, who have a keen personal interest of maintaining the network.

Message:

READING THIS COULD CHANGE YOUR LIFE! I found this=20
on a=20
bulletin board and decided to try it. A little while back, I was =
browsing=20
through newsgroups, just like you are now, and came across an article=20
similar to this that said you could make thousands of dollars within=20
weeks with only an initial investment of $6.00! So I thought, "Yeah=20
right, this must be a scam", but like most of us, I was curious, so I =
kept=20
reading. Anyway, it said that you send $1.00 to each of the 6 names=20
and address stated in the article. You then place your own name and=20
address in the bottom of the list at #6, and post the article in at =
least=20
200 newsgroups. (There are thousands) No catch, that was it. So after=20
thinking it over, and talking to a few people first, I thought about =
trying=20
it. I figured: "what have I got to lose except 6 stamps and $6.00, =
right?"=20
```

Then I invested the measly $6.00. Well GUESS WHAT!!...within 7=20
days, I started getting money in the mail! I was shocked! I figured it=20
would end soon, but the money just kept coming in. In my first week, I=20
made about $25.00. By the end of the second week I had made a total=20
of over $1,000.00! In the third week I had over $10,000.00 and it's =
still
growing. This is now my fourth week and I have made a total of just=20
over $42,000.00 and it still coming in rapidly. It's certainly worth=20
$6.00, & 6 stamps, I have spent more than that on the lottery!! Let me=20
tell you how=20
this works and most importantly, why it works....Also, make sure you=20
print a copy of this article NOW, so you can get the information off of=20
it as you need it. I promise you that if you follow the directions =
exactly,=20
that you will start making more money than you thought possible by=20
doing something so easy! Suggestion: Read this entire message=20
carefully! (print it out or download it.) Follow the simple directions =
and=20
watch the money come in! It's easy. It's legal. And, your investment is=20
only $6.00 (Plus postage) IMPORTANT:=20
This is not a rip-off; it is not indecent; it is not illegal; and it is =
virtually=20
no risk - it really works!!!! If all of the following instructions are=20
adhered to, you will
receive extraordinary dividends. PLEASE NOTE: Please follow these
directions EXACTLY, and $50,000 or more can be yours in 20 to 60=20
days. This program remains successful because of the honesty and=20
integrity of the participants. Please continue its success by carefully=20
adhering to the instructions. You will now become part of the Mail=20
Order business. In this business your product is not solid and tangible, =

it's a service. You=20
are in the business of developing Mailing Lists. Many large=20
corporations are happy to pay big bucks for quality lists. However,=20
the money made from the
mailing lists is secondary to the income which is made from people=20
like you and me asking to be included in that list. Here are the 4 easy=20
steps to success: STEP 1: Get 6 separate pieces of paper and write the=20
following on each piece of paper "PLEASE PUT ME ON YOUR=20
MAILING LIST." Now get 6 US $1.00 bills and place ONE inside=20
EACH of the 6 pieces of paper so the bill will not be seen through the=20
envelope (to prevent thievery). Next, place one paper in each of the 6=20
envelopes and seal them. You should now have 6 sealed envelopes,=20
each with a piece of paper stating the above phrase, your name and=20
address, and a $1.00 bill. What you are doing is creating a service.=20
THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate=20
service and you are paying for it! Like most of us I was a little=20
skeptical and a little worried about the legal aspects of it all. So I=20
checked it out with the U.S. Post Office (1-800-725-2161) and they=20
confirmed that it is indeed legal! Mail the 6 envelopes to the following =

addresses:

#1) Samantha Blizniak, 7937 S. Newcastle, Burbank, IL 60459

#2)Katie Wiess, 14 White Tail Lane, Wallingford, CT 06492

#3)Traci Wood, 4224 Carnwath Rd., Tallahassee, FL 32303

#4)Milissa Crook, 3730 South 255th Place, Kent, WA 98032

#5)James Buckner, 11903 Coit RD. #1803 Dallas, TX 75251

#6)Bobbi Mullins, 31 Sunnydale Lane, Napoleon, OH 43545

STEP 2: Now take the #1 name off the list that you see above, move=20
the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR=20
Name as number 6 on the list. STEP 3: Change anything you need to,=20
but try to keep this article as close to original as possible. Now, post =

your amended article to at least 200 newsgroups. (I think there are=20
close to 24,000 groups) All you need is 200, but remember, the more=20
you post, the more money you make! This is perfectly legal! If you=20
have any doubts, refer to Title 18 Sec. 1302 & 1341 of the Postal=20
lottery laws. Keep a copy of these steps for yourself and, whenever=20
you need money, you can use it again, and again. PLEASE
REMEMBER that this program remains successful because of the=20
honesty & integrity of the participants & by their carefully adhering to =

the directions. Look at it this way. If you are of integrity, the =
program=20
will continue and the money that so many others have received will=20
come your way. NOTE: You may want to retain every name and=20
address sent to you, either on a computer or hard copy and keep the=20
notes people send you. This VERIFIES that you are truly providing a=20
service. (Also, it might be a good idea to wrap the $1 bill in dark =
paper=20
to reduce the risk of mail theft.) So, as each post is downloaded and =
the=20
directions carefully followed, six members will be reimbursed for their=20
participation as a List Developer with one dollar each. Your name will=20
move up the list geometrically so that when your name reaches the #1=20
position you will be receiving thousands of dollars in CASH!!! What an=20
opportunity for only $6.00 ($1.00 for each of the first six=20
people listed above) Send it now, add your own name to the list and=20
you're in business!=20
---DIRECTIONS -----=20
FOR HOW TO POST TO NEWSGROUPS------------=20
Step 1) You do not need to re-type this entire letter to do your own=20
posting. Simply put your cursor at the beginning of this letter and drag =

your cursor to the bottom of this document, and select 'copy' from the=20
edit menu. This will copy the entire letter into the computer's memory.
Step 2) Open a blank 'notepad' file and place your cursor at the top of=20
the blank page. From the 'edit' menu select 'paste'. This will paste a=20

copy of the letter into notepad so that you can add your name to the
list.=20
Step 3) Save your new notepad file as a .txt file. If you want to do =
your=20
postings in different settings, you'll always have this file to go back =
to.=20
Step 4) Use Netscape or Internet explorer and try searching for various=20
newsgroups (on-line forums, message boards, chat sites, discussions.)
Step 5) Visit these message boards and post this article as a new=20
message by highlighting the text of this letter and selecting paste from =

the edit menu. Fill in the Subject, this will be the header that =
everyone=20
sees as they scroll through the list of postings in a particular group,
click the post message button. You're done with your first one!
Congratulations...THAT'S IT! All you have to do is jump to different=20
newsgroups and post away, after you get the hang of it, it will take=20
about 30 seconds for each newsgroup! **REMEMBER, THE MORE=20
NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL=20
MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200** That's=20
it! You will begin receiving money from around the world within days!=20
You may eventually want to rent a P.O.Box due to the large amount of=20
mail you will receive. If you wish to stay anonymous, you can invent a=20
name to use, as long as the postman will deliver it. **JUST MAKE
SURE ALL THE ADDRESSES ARE=20
CORRECT.** Now the WHY part: Out of 200 postings, say I receive=20
only 5 replies (a very low example). So then I made $5.00 with my
name at #6 on the letter. Now, each of the 5 persons who just sent me=20
$1.00 make the MINIMUM 200 postings, each with my name at #5=20
and only 5 persons respond to each of the original 5, that is another=20
$25.00 for me, now those 25 each make 200 MINIMUM posts with=20
my name at #4 and only 5 replies each, I will bring in an additional=20
$125.00! Now, those 125 persons turn around and post the MINIMUM=20
200 with my name at #3 and only receive 5 replies each, I will make an=20
additional $626.00! OK, now here is the fun part, each of those 625=20
persons post a MINIMUM 200 letters with my name at #2 and they=20
each only receive 5 replies, that just made me $3,125.00!!!=20
Those 3,125 persons will all deliver this message to 200 newsgroups
with my name at #1 and if still 5 persons per 200 newsgroups react I=20
will receive $15,625,00! With an original investment of only $6.00!=20
AMAZING! When your name is no longer on the list, you just take the=20
latest posting in the newsgroups, and send out another $6.00 to names=20
on the list, putting your name at number 6 again. And start posting=20
again. The thing to remember is: do you realize that thousands of=20
people all over the world are joining the internet and reading these
articles everyday?, JUST LIKE YOU are now!! So, can you afford
$6.00 and see if it really works?? I think so... People have said, "what
if the plan is played out and no one sends you the money? So what!
What are the chances of that happening when there are tons of new
honest users and new honest people who are joining the internet and
newsgroups everyday and are willing to give it a try? Estimates are at=20
20,000 to 50,000 new users, every day, with thousands of those
joining the actual internet.Remember, play FAIRLY and HONESTLY

and this will really work

size=3D2>like=20
you and me asking to be included in that list. Here are the 4 easy=20
</FONT><BR><FONT face=3DArial size=3D2>steps to success: STEP 1: Get 6 =
separate=20
pieces of paper and write the </FONT><BR><FONT face=3DArial =
size=3D2>following on=20
each piece of paper "PLEASE PUT ME ON YOUR </FONT><BR><FONT face=3DArial =

size=3D2>MAILING LIST." Now get 6 US $1.00 bills and place ONE inside=20
</FONT><BR><FONT face=3DArial size=3D2>EACH of the 6 pieces of paper so =
the bill=20
will not be seen through the </FONT><BR><FONT face=3DArial =
size=3D2>envelope (to=20
prevent thievery). Next, place one paper in each of the 6 =
</FONT><BR><FONT=20
face=3DArial size=3D2>envelopes and seal them. You should now have 6 =
sealed=20
envelopes, </FONT><BR><FONT face=3DArial size=3D2>each with a piece of =
paper stating=20
the above phrase, your name and </FONT><BR><FONT face=3DArial =
size=3D2>address, and=20
a $1.00 bill. What you are doing is creating a service. </FONT><BR><FONT =

face=3DArial size=3D2>THIS IS ABSOLUTELY LEGAL! You are requesting a =
legitimate=20
</FONT><BR><FONT face=3DArial size=3D2>service and you are paying for =
it! Like most=20
of us I was a little </FONT><BR><FONT face=3DArial size=3D2>skeptical =
and a little=20
worried about the legal aspects of it all. So I </FONT><BR><FONT =
face=3DArial=20
size=3D2>checked it out with the U.S. Post Office (1-800-725-2161) and =
they=20
</FONT><BR><FONT face=3DArial size=3D2>confirmed that it is indeed =
legal! Mail the 6=20
envelopes to the following </FONT><BR><FONT face=3DArial=20
size=3D2>addresses:</FONT><BR><BR><FONT face=3DArial size=3D2>#1) =
Samantha Blizniak,=20
7937 S. Newcastle, Burbank, IL 60459</FONT><BR><BR><FONT face=3DArial=20
size=3D2>#2)Katie Wiess, 14 White Tail Lane, Wallingford, CT=20
06492</FONT><BR><BR><FONT face=3DArial size=3D2>#3)Traci Wood, 4224 =
Carnwath Rd.,=20
Tallahassee, FL 32303</P></FONT>
<P><BR><FONT face=3DArial size=3D2>#4)Milissa Crook, 3730 South 255th =
Place, Kent,=20
WA 98032</FONT><BR><BR><FONT face=3DArial size=3D2>#5)James Buckner, =
11903 Coit RD.=20
#1803 Dallas, TX 75251</P>
<P>#6)Bobbi Mullins, 31 Sunnydale Lane, Napoleon, OH =
43545</FONT><BR><BR><FONT=20
face=3DArial size=3D2>STEP 2: Now take the #1 name off the list that you =
see above,=20
move </FONT><BR><FONT face=3DArial size=3D2>the other names up (6 =
becomes 5, 5=20
becomes 4, etc...) and add YOUR </FONT><BR><FONT face=3DArial =
size=3D2>Name as=20
number 6 on the list. STEP 3: Change anything you need to, =
</FONT><BR><FONT=20
face=3DArial size=3D2>but try to keep this article as close to original =
as possible.=20
Now, post </FONT><BR><FONT face=3DArial size=3D2>your amended article to =
at least=20
200 newsgroups. (I think there are </FONT><BR><FONT face=3DArial =
size=3D2>close to=20
24,000 groups) All you need is 200, but remember, the more =
</FONT><BR><FONT=20
face=3DArial size=3D2>you post, the more money you make! This is =
perfectly legal! If=20
you </FONT><BR><FONT face=3DArial size=3D2>have any doubts, refer to =
Title 18 Sec.=20
1302 &amp; 1341 of the Postal </FONT><BR><FONT face=3DArial =
size=3D2>lottery laws.=20
Keep a copy of these steps for yourself and, whenever </FONT><BR><FONT=20
face=3DArial size=3D2>you need money, you can use it again, and again.=20
PLEASE</FONT><BR><FONT face=3DArial size=3D2>REMEMBER that this program =
remains=20
successful because of the </FONT><BR><FONT face=3DArial size=3D2>honesty =
&amp;=20
integrity of the participants &amp; by their carefully adhering to=20
</FONT><BR><FONT face=3DArial size=3D2>the directions. Look at it this =
way. If you=20
```

```
are of integrity, the program </FONT><BR><FONT face=3DArial =
size=3D2>will continue=20
and the money that so many others have received will </FONT><BR><FONT =
face=3DArial=20
size=3D2>come your way. NOTE: You may want to retain every name and=20
</FONT><BR><FONT face=3DArial size=3D2>address sent to you, either on a =
computer or=20
hard copy and keep the </FONT><BR><FONT face=3DArial size=3D2>notes =
people send you.=20
This VERIFIES that you are truly providing a </FONT><BR><FONT =
face=3DArial=20
size=3D2>service. (Also, it might be a good idea to wrap the $1 bill in =
dark paper=20
</FONT><BR><FONT face=3DArial size=3D2>to reduce the risk of mail =
theft.) So, as=20
each post is downloaded and the </FONT><BR><FONT face=3DArial =
size=3D2>directions=20

eventually want to rent a P.O.Box due to the large amount of =
</FONT><BR><FONT=20
face=3DArial size=3D2>mail you will receive. If you wish to stay =
anonymous, you can=20
invent a </FONT><BR><FONT face=3DArial size=3D2>name to use, as long as =
the postman=20
will deliver it. **JUST MAKE</FONT><BR><FONT face=3DArial size=3D2>SURE =
ALL THE=20
ADDRESSES ARE </FONT><BR><FONT face=3DArial size=3D2>CORRECT.** Now the =
WHY part:=20
```

```
Out of 200 postings, say I receive </FONT><BR><FONT face=3DArial =
size=3D2>only 5=20
replies (a very low example). So then I made $5.00 with =
my</FONT><BR><FONT=20
face=3DArial size=3D2>name at #6 on the letter. Now, each of the 5 =
persons who just=20
sent me </FONT><BR><FONT face=3DArial size=3D2>$1.00 make the MINIMUM =
200 postings,=20
each with my name at #5 </FONT><BR><FONT face=3DArial size=3D2>and only =
5 persons=20
respond to each of the original 5, that is another </FONT><BR><FONT =
face=3DArial=20
size=3D2>$25.00 for me, now those 25 each make 200 MINIMUM posts with=20
</FONT><BR><FONT face=3DArial size=3D2>my name at #4 and only 5 replies =
each, I will=20
bring in an additional </FONT><BR><FONT face=3DArial size=3D2>$125.00! =
Now, those=20
125 persons turn around and post the MINIMUM </FONT><BR><FONT =
face=3DArial=20
size=3D2>200 with my name at #3 and only receive 5 replies each, I will =
make an=20
</FONT><BR><FONT face=3DArial size=3D2>additional $626.00! OK, now here =
is the fun=20
part, each of those 625 </FONT><BR><FONT face=3DArial size=3D2>persons =
post a=20
MINIMUM 200 letters with my name at #2 and they </FONT><BR><FONT =
face=3DArial=20
size=3D2>each only receive 5 replies, that just made me $3,125.00!!!=20
</FONT><BR><FONT face=3DArial size=3D2>Those 3,125 persons will all =
deliver this=20
message to 200 newsgroups</FONT><BR><FONT face=3DArial size=3D2>with my =
name at #1=20
and if still 5 persons per 200 newsgroups react I </FONT><BR><FONT =
face=3DArial=20
size=3D2>will receive $15,625,00! With an original investment of only =
$6.00!=20
</FONT><BR><FONT face=3DArial size=3D2>AMAZING! When your name is no =
longer on the=20
list, you just take the </FONT><BR><FONT face=3DArial size=3D2>latest =
posting in the=20
newsgroups, and send out another $6.00 to names </FONT><BR><FONT =
face=3DArial=20
size=3D2>on the list, putting your name at number 6 again. And start =
posting=20
</FONT><BR><FONT face=3DArial size=3D2>again. The thing to remember is: =
do you=20
realize that thousands of </FONT><BR><FONT face=3DArial size=3D2>people =
all over the=20
world are joining the internet and reading these</FONT><BR><FONT =
face=3DArial=20

Your response to my observation reveals a superior, elitist attitude.
Get a grip. Hams do this stuff for fun. If we DO happen to make a few
improvements in the technology, all the better.
You should go play with model trains or boats.

>I claim that the decline of the packet radio network was due to direct internet access by licensed amateur radio operators. i.e. these messages were never transported by amateur radio means neither locally nor through any packet radio link chains.

That may very well be true. In de early days of the packet radio BBS network, this network was the first way for many radio amateurs to transport e-mail to their friends all over the world, read news bulletins, etc.

Ok, there was the Fidonet network, but access was usually difficult (telephone lines BUSY all the time), and there were variable costs like telephone charges and message charges by the sysop.

But with the advent of private-user Internet access, any guy in the street can send and receive e-mail and access information, so why would you do it via packet radio and be able to reach only a small number of users and access only limited amounts of information?

This hasn't only killed the packet network, but the Fido network as well! (in the same way: some people desperately try to keep smaller and smaller parts of it alive, fighting against the Internet using the same arguments as HAMs use to keep the packet network alive)

It is like the 2M Handheld. In its early days (the Icom IC-2), every amateur wanted a handheld and they used it to chat on the local repeater, communicate with friends while visiting rallys, and sometimes even carry it on the street and be able to chat with someone while shopping.
Everyone else would see those guys as geeks. But now, everyone has a GSM phone and is doing exactly the same things.
But who is still using his 2M handheld? Mine has been in the closet for years, with defective NiCd batteries.

Apparently there are trends, sometimes radio amateurs are early adopters, and after a while these things die off again. Another trend appears, interest peaks, and the same thing happens.
Right now, many of the still active radio amateurs are in FM ATV. This has some of the characteristics of many trends in amateur radio: surplus equipment is available that makes part of the job easier (phased-out satellite TV indoor units that became worthless when sats went digital), and interesting parts came on the market that made constructing a UHF/SHF transmitter easier for the average amateur.
But of course, the surplus unit supply will dry up, the parts will disappear (because integration advances, and the customized parts that replace them are no longer usable by amateurs - has happened many times!).
Also, the bands quickly get filled by these wideband signals, and we may lose some of these bands in the near future.

So, this will probably be temporary as well, just like packet radio.
Besides, with all these trends a factor is that it gets boring after some time. When the initial thrill is over, only the really dedicated operators remain on the mode. The rest moves on.

Rob

"Gary Coffman" wrote

>
> Yeah, some people are working on it. We did digital voice here back in 1990, high fidelity at 56 kb in a 100 kHz channel. Since then there has been much progress with codecs to the point where the required data rates for toll grade speech have fallen 10 fold.

I forget the mans name, but he developed a packet radio digital voice application back in the late 80's. It was kind of neat. Many old timers will recall a program for the PC that played voice over the speaker and sang "Daisy." This was a 1 bit software A/D and with compression was easily transported by even 1200 baud. I used the same software idea (PC 8 kHz software interrupt), only I sampled an 8 bit A/D. I wasn't very good with Op-Amps back then, and bought a Covox card that had an 8 bit A/D with a very nice audio section.

I found that once you had audio in a sampled digital form, that you could do many things with it. First of which, is block it up into 20 ms segments, and second to wrap it with other digital information.

> That takes it out of the special RF modem range and down into the range where the digital signal can be crammed through an ordinary FM voice grade radio occupying a 15 kHz channel. But guess what, we've been putting toll quality speech through voice grade FM radios for over half a century. Nothing new here.

I don't think getting digital voice below 5 kHz is the issue. In my opinion, getting digital voice down to 5 kHz that sounds good is the issue.

Bandwidth right now is chopped up in frequency domain slices, and legal entities must be incorporated to assign these channels (as we call them). We also have the time domain to consider. If we could get digital audio that fits in a 5 kHz bandwidth (and we can now) then other coding schemes can be used.

Take a simple TDMA coding scheme. With TDMA you could easily have 4 channels of voice (or voice and data) in one 5 kHz channel quite easily, and there is aslo CDMA.

Both of these take the same "channel" and use it for four things. Therefore we have 5 kHz divided by four in a digital setting, and 5 kHz divided by one in an analog setting.

> Now if the average amateur didn't insist on doing digital through his Yaekencom FM voice radio, we could build special RF modems that would occupy less bandwidth than a FM analog voice signal.

Wouldn't increasing the channel occupancy do the same thing?

> We could squeeze it into as little as 600 Hz of occupied bandwidth. But don't hold your breath waiting for that to happen.

Then you're offering the group here a solution that even you don't believe will ever happen. How valuable is that?

> It has as little chance as the widespread adoption of the 56 kb MSK RF modem we've had available since 1989. Most amateurs won't buy it if it doesn't come from Japan ready to plug and play (and the plugs better be prewired, see Rigblaster).

Everything gets down to personalities. If the 56 k modem was any good, then it would have been marketed. Failure in marketing kills more businesses than financial mismanagement. You can fix the later, but once you miss your target on the first, you are ready to stick a fork in it (dead meat). If you could have got a real distributor to put it out, instead of a mom and pop operation, then the modem might have made some real money. Wide band modems is not where terrestrial communications are headed. The P3 satellite might support that waste of bandwidth, but it has a time domain as well (called an orbit).

> Now there are some real benefits to digitized voice. We can route it, for example, over a digital network to give us linked systems such as we never dreamed were possible a few years ago. We can use FEC to push it through noisy links. Etc. But the chance that it will conserve occupied bandwidth is practically nil.

I disagree for the reasons I gave above.

> Amateurs will still be using voice grade FM radios to carry the digital audio signals.

However, it is multiplexed with other digital signals (callsign, smart squelch, etc).

> Having observed amateurs for 35 years, I think not. If it can't be added
> as a simple accessory to their analog radios, they aren't going to do it.

The issue isn't if three people do it, it is if two people will. That's how any new mode gets started. If it is fun, then two will increase at an exponential rate, and then at some future date, as people get bored, a linear brick wall type of free-fall occurs as everyone sells thier junk at a swap meet in Dayton...

You keep blaming the Japanese, but I haven't seen any 4 color ad's out of PacComm, so I don't expect wideband modems to begin selling like hot-cakes, especially since they don't have little buttons that go beep, or video displays that have your callsign in them...

Marketing...

> We aren't radio amateurs anymore, we're just radio users, not much
> different from CBers.

I take offense to this. Just because you are bored and no one is joining your club, is no indication that other Amateurs are not having fun. I see excellent projects out there, and if you don't then I can only suggest that you have the wrong friends, or club.

I think this is an exciting time in Ham radio, and that everything we've (not me, the hobby) done in the past, will be valuable to the next popular mode.

Darn it Steve, will you please *stop* this!
I agree with everything you said.

In particular, it is also my opinion that the biggest failure has been
the failure to market the more interesting products well, and the
failure to adapt them to what the "mass market" wants.

See some comments below.
Maybe someone from PACCOM is listening.

Total nonesense. Nobody cares whether it comes from Japan, or
Burundi, or Florida! It *does* need to be available in some "plug
it into things, it works" form though. Hams need to be made aware
of the product, and made aware of the reasons they might want it.
i.e. full page color ads in the major ham magazines, articles written
to build the hype, etc. etc. This is the *only* way to drive down
the cost.

That's what happened with 1200 baud / 300 baud packet. It was new.
It was hot. Everyone wanted to play. There was a type of application
new to ham radio (yes, I know about RTTY mail drops).

> > I'm sorry to be so down here, but this is the reality we've been facing

Which can drive interest and acceptance, which can then drive the
cost reduction required. Remember that the TNC1 cost $350 ...
and it was a kit. TNCs are no longer percieved as "neat new hot
stuff", but simply as "another possibly useful station accesory".
How to make it "neat new hot stuff"? Probably tcp/ip potential, but
that too must be marketed.

An interesting point that is not often discussed: what was the actual
technical innovation of packet radio? It wasn't the modem, there were
plenty of 1200 baud (and much faster) modem technology at the time.
It wasn't the ability to send text over ham radio; RTTY had been around
for a long time. It wasn't the ability to send programs over ham radio,
that had been done for years, using RTTY (e.g. WB6UUT). The only
thing new and different was the ability to network computers together.

The innovation was the actual building of those networks. At first simple
store and forward and trivial gateway capability. Later the potential
to use internet protocols. It was all about cooperation in a large scale
project involving thousands of hams. Once that project was complete,
many hams moved on to other facits of the hobby. None of this was
any big surprise to those of us who kicked it all off. It's how fads usually
work: a few start them off, a lot of people pick them up, and then
they die out.

The puzzle is how to do this again, now that fast networking is possible.

I look at some of the players in packet by monitoring their web pages. While I like simple HTML, the manufacturers of Ham Equipment are extremely weak in their presentation. Some of them haven't changed in years. One of them (who I shouldn't name) doesn't even answer email from the link given.

It's almost like they are making too much money as it is, but I suspect that they can just barely meet demand, and advertising would only run up manufacturing costs to get to the next level. I'm only guessing...

Another repeater controller startup is completely absent in email. If you don't want email, tell the customer! Don't make them wait a week and decide to call. Tell them to call--you don't do email! Sheesh.

The NTSB has released its SUV data last week.

Early in the year they had SUV manufacturers secretly install
Cockpit Voice Recorder (CVR) chip in all vehicles coming into
the American market.

The graphs clearly show that in 47 States the last words on the
CVR chip was "Oh Shit!" In three States (Oklahoma, Arkansas,
and Texas) the last words were "Hold my beer, and watch this!"

They didn't say where the chip was located.

Do the same thing here. Try to hit 'em all at least once per
month in case there are firmware updates, new products, etc.

I know exactly who you mean with the broken email.
A simple query about an older product never got a reply.

Some manufacturers do better.
A query to HAL got a reply from the president, same day.

> It's almost like they are making too much money as it is, but
> I suspect that they can just barely meet demand, and advertising
> would only run up manufacturing costs to get to the next
> level. I'm only guessing...

From what I know, this is in fact the situation. Demand for higher
speed network gear is just not there. One needs the hype to
build that demand before any manufacturer will be able to put
together a business plan that makes any sense. I've tried putting
together a couple business plans for such products, and although
one of the scenarios looked like it might work, the potential ROI
just didn't look worth the bother. Events have born out my
decision not to put my money where my mouth was.

The successful business plans count on revenue from non-ham
sources. In some cases, essentially all *profit* comes from
those sources, and the ham products only exist because of
specific interest by the business owner.

Software products are a different kettle of fish. I suspect several
hams have made reasonable amounts of money with their software.

Yup, but fewer and fewer... It is hard to tinker when you can go into WalMart and buy something that seems to do it all and more and better. And, when that gadget is hard to open and modify it really puts a damper on things.

But there is still room, just not a lot of interest. And as you see by some of the tangental discussions to your post, some seem to think we should just can the whole thing. Oh well. To each his own, and hopefully the law will continue to allow room for the individual experimenter.

If I have a packet transceiver operating at my home qth receiving and transmitting APRS information am I then allowed to leave that device operating unattended and activate and operate a mobile APRS rig away from my house. I know I can operate more than one rig when I am present but am curious about the legality of operating from my car while my base station continues to archive APRS info.

Any help would be appreciated.

It seems like a moot point to me... You already know your home qth's
location, which is highly unlikely to change. What point is there in
transmitting APRS data on a known, fixed location?

Maybe there's a real need there, that I'm having trouble seeing. If there
is, don't worry about it. Lots of unattended VHF/UHF Packet stations
transmit, and I've never heard of anyone getting into a crack over it.

> or 3.620-3.635 MHz segments.

Charles, APRS stations not only transmit their position, but also digipeat positions and messages of others. It only took me a second to look up the rule. Amateurs should not guess about something which will cause them to be fined or evicted from the bands, therefore your reply seems to advise him to do whatever he wants, as no one you know was "getting into a crack over it" which I assume to be some reference to the human posterior. If you don't know, guessing is a bad habit.

I have not been following the APRS talk close enough to know if there has been any discussion about a dedicated 70cm. APRS frequency.

In southwest Virginia there is very little APRS activity. I am not really sure why this is, people have to actually build something and they do not have the ability anymore?

I would like to build some trackers, but to dedicate a two meter synthesized mobile or handheld is not economical. The kits to build transmitters and receivers end up being just as costly.

Tekk dropped its vhf mini-transceivers but still make the uhf. These units are just what I would like to use, but without a dedicated 70cm frequency, I might interfere with someone else.

I looked at TAPR's site and there was mention of a frequency, but I have not heard anything else about it.

So, can anyone shed some light on this?

Thanks,
Fred Mahone

There have been a few discussions on TAPR's aprssig mailing list, but no conclusions. You should probably check to see if your area has a bandplan which addresses this. The bandplans differ quite a bit between areas and it will take a lot of coordination to establish a common frequency (as it did to get the 144.39 APRS frequency set up). In the absence of anything in the bandplan, check out simplex frequencies in your area. You'll probably find several that are not being used. The local frequency coordinator (listed in the ARRL repeater directory) should be able to help.

Is this how LandLine Lids such as yourself decide it's "OK" to transmit
commercial content (and porno, etc) from the Internet over the Ham bands?

Just curious. ;-)

In Southern California, the SCDCC has considered such a question, but decided not to suggest an allocation for 70cm APRS until the 2m APRS users state that the frequency is too crowded to be usable. I have seen some times where my TNC's rx light stays on for 5-10 seconds at a time because of APRS packets crammed next to each other.

Unlike other modes, APRS is designed to use a single frequency REGARDLESS of the number of stations. Moving its digipeater backbone to another frequency also defeats its purpose. I'm not saying that it's not possible. However, there is a reason why APRS is on the same frequency nationwide......

I found out the name - of the AEA software, that has been discontinued for a few years (according to the support people at Timewave) . It's called ACARS 900 - this alllows the PK 900 to monitor ACARS....

Anyone have a copy of this they aren't using??

Attention!! This is not a scam, this is the real deal--this is money in =
your pocket!
Note:  I made the $6 leap of faith and it is paying off big time!  You =
should too.
Just read what is below and see for yourself.  This will change your =
life:

$6 Investment to make $1000s

: Make A Lot Of Money Fast !!!!!

:=20
: A while back, I was browsing newsgroups, just like you, I came across =
an article similar to this that said you could make thousands of CASH =
within weeks with only an initial investment of $6.00 plus stamps! So I =
thought, "Yeah, right, this must be a scam!" But like most of us I was =
curious and kept reading. It said that if you send $1.00 to each of the =
6 names and addresses listed in the article, you could make thousands in =
a very short period of time. You then place your own name and address at =
the bottom of the list at #6, and post the article to at least 300 =
newsgroups. (There are about 32,000 of them out there and that's quite a =
large market pool). No catch, that was it. Even though the investment =
was a measly $6, I had three questions that needed to be answered before =
I could get involved in this sort of thing.=20

: 1. IS THIS REALLY LEGAL? I called a lawyer first. The lawyer was a =
little sceptical that I would actually make any CASH but he said it WAS =
LEGAL if I wanted to try it. I told him it sounded a lot like a chain =
letter but the details of the system (SEE BELOW) actually made it a =
legitimate legal business.=20

: 2. IS OK WITH THE POST OFFICE OR IS IT MAIL FRAUD? I called them: =
1-800-725-2161 and they confirmed THIS IS ABSOLUTELY LEGAL! (See 18, h =
sections1302 NS 1341 of Postal Lottery Laws). This clarifies the program =
of collecting names and addresses for a mailing list.=20

: 3. IS IT RIGHT? Well, everyone who sends me a buck has a good chance =
of getting A LOT of CASH ... a much better chance than buying a lottery =
ticket!!! So, having these questions answered, I invested EXACTLY $7.92 =
... six $1.00 bills and six 32 cent postage stamps ... and boy am I glad =
I did!!! Within 7 days, I started getting CASH in the mail! I was =
shocked! I figured it would end soon and didn't give it another thought. =
But the CASH continued coming in. In my first week I made between $20 to =
```

$30. By the end of the second week I had a made a total of $1,000.00. In =
the third week I had over $10,000.00 and it was still growing. This is =
now my fourth week and I have made a total of just over $42,000 and it's =
still coming in...=20

: It's certainly worth $6.00 and 6 stamps !!! Also, make sure you print =
a copy of this article NOW, so you can get the information off of it as =
you need it. I promise you that if you follow the directions exactly, =
that you will start making more CASH than you thought possible by doing =
something so easy! Suggestion: Read this entire message carefully! =
(print it out or download it.) Follow the simple directions and watch =
the CASH come in! It's easy. It's legal. And, your investment is only =
$6.00 (Plus postage) IMPORTANT: This is not a rip-off; it is not =
indecent; it is not illegal; and it is virtually no risk - it really =
works!!!! If all of the following instructions are adhered to, you will =
receive extraordinary dividends.=20

: PLEASE NOTE: Please follow these directions EXACTLY, and $50,000 or =
more can be yours in 20 to 60 days. This program remains successful =
because of the honesty and integrity of the participants. Please =
continue its success by carefully adhering to the instructions. You will =
now become part of the Mail Order business. In this business your =
product is not solid and tangible, it's a service. You are in the =
business of developing Mailing Lists. Many large corporations are happy =
to pay big bucks for quality lists. However, the CASH made from the =
mailing lists is secondary to the income which is made from people like =
you and me asking to be included in that list.=20

: Here are the 4 easy steps to success:=20

: STEP 1: Get 6 separate pieces of paper and write the following on each =
piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US $1.00 =
bills and place ONE inside EACH of the 6 pieces of paper so the bill =
will not be seen through the envelope (to prevent thievery). Place one =
paper in each of the 6 envelopes and seal them. You should now have 6 =
sealed envelopes, each with a piece of paper stating the above phrase, =
your name and address, and a $1.00 bill. What you are doing is creating =
a service. THIS IS ABSOLUTELY LEGAL! You are requesting a legitimate =
service and you are paying for it! Like most of us I was a little =
skeptical and a little worried about the legal aspects of it all. So I =
checked it out with the U.S. Post Office (1-800-725-2161) and they =
confirmed that it is indeed legal! Mail the 6 envelopes to the following =
addresses:=20

:=20
:=20

: #1) Aditya Venkataraman 14215 Lake Trail Driv Sugar Land, Texas 77478=20

: #2) Charlie Baltimore 71-20 Sutton Place #3 Fresh Meadows, NY 11365=20

: #3) Shaun Littman 3061 Clubhouse Road Merrick, N.Y. 11566=20

: #4) Joseph Morris P.O. Box 37 Union Grove, Al 35175=20

: #5) M. Dixon P.O. Box 767412 Roswell, GA 30076

: #6) Lee Higginbotham 8505 Columbus Ave. #209 North Hills, CA 91343
:=20
: STEP 2: Now take the #1 name off the list that you see above, move the =
other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as =
number 6 on the list. DO NOT JUST COPY OVER THE LAST NAME, BUT REMEMBER =
TO MOVE EACH NAME UP ONE LINE!!!!!!!!=20

: STEP 3: Change anything you need to, but try to keep this article as =
close to original as possible. Now, post your amended article to at =
least 300 newsgroups. (I think there are close to 32,000 groups) All you =
need is 300, but remember, the more you post, the more CASH you make!=20

: This is perfectly legal! If you have any doubts, refer to 18 Sec. 1302 =
& 1341 of the Postal lottery laws. Keep a copy of these steps for =
yourself and, whenever you need CASH, you can use it again, and again.=20

: PLEASE REMEMBER that this program remains successful because of the =
honesty and integrity of the participants and by their carefully =
adhering to the directions. Look at it this way. If you are a person of =
integrity, the program will continue and the CASH that so many others =
have received will come your way.=20

: NOTE: You may want to retain every name and address sent to you, =
either on a computer or hard copy and keep the notes people send you. =
This VERIFIES that you are truly providing a service. (Also, it might be =
a good idea to wrap the $1 bill in dark paper to reduce the risk of mail =
theft.) So, as each post is downloaded and the directions carefully =
followed, six members will be reimbursed for their participation as a =
List Developer with one dollar each. Your name will move up the list so =
that when your name reaches the #1 position you will be receiving =
thousands of DOLLARS in CASH!!! What an opportunity for only $6.00. Send =
it now, add your own name to the bottom of the list and you're in =
business!=20

: ---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS=20

: Step 1) You do not need to re-type this entire letter to do your own =
posting. Simply put your cursor at the beginning of this letter and drag =
your cursor to the bottom of this letter, and select 'copy' from the =
edit menu. This will copy the entire letter into the computer's memory.=20

: Step 2) Open a blank 'notepad' file and place your cursor at the top =
of the blank page. From the 'edit' menu select 'paste'. This will paste =
a copy of the letter into notepad so that you can add your name to the =
list.=20

: Step 3) Save your new notepad file as a .txt file. If you want to do =
your postings in different settings, you'll always have this file to go =
back to.=20

: Step 4) Use Netscape or Internet explorer and try searching for =
various newsgroups (on-line forums, message boards, chat sites, =
discussions.)=20

: Step 5) Visit these message boards and post this article as a new =
message by highlighting the text of this letter and selecting paste from =
the edit menu. Fill in the Subject, this will be the header that =
everyone sees as they scroll through the list of postings in a =
particular group, click the post message button.=20

: You're done with your first one! Congratulations...THAT'S IT! All you =
have to do is jump to different newsgroups and post away, after you get =
the hang of it, it will take about 30 seconds for each newsgroup!=20

: **REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE CASH YOU WILL =
MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 300** That's it! You will begin =
receiving CASH from around the world within days! You may eventually =
want to rent a P.O.Box due to the large amount of mail you will receive. =
If you wish to stay anonymous, you can invent a name to use, as long as =
the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE =
CORRECT.**=20

: Now the WHY part:=20

: Out of 300 postings, say I receive only 7 replies (a very low =
example). So then I made $7.00 with my name at #6 on the letter. Now, =
each of the 7 persons who just sent me $1.00 make the MINIMUM 300 =
postings, each with my name at #5 and only 7 persons respond to each of =
the 7 original 7, that is another $49.00 for me, now those 49 each make =
300 MINIMUM posts with my name at #4 and only 7 replies each, I will =
bring in an additional $343.00! Now, those 343 persons turn around and =
post the MINIMUM 300 with my name at #3 and only receive 7 replies each, =
I will make an additional $2401.00! OK, now here is the fun part, each =
of those 2401 persons post a MINIMUM 300 letters with my name at #2 and =
they each only receive 7 replies, that just made me $16,807.00!!! Those =
16807 persons will all deliver this message to 300 newsgroups with my =
name at #1 and if still 7 persons per 300 Newsgroups react I will =
receive $117,649.00! With an original investment of only $6.00! And some =
stamps. AMAZING! When your name is no longer on the list, you just take =
the latest posting in the newsgroups, and send out another $6.00 to =
names on the list, putting your name at number 6 again. And start =
posting again.=20

: The thing to remember is: Thousands of people all over the world are =
joining the internet and reading these articles everyday? JUST LIKE YOU =
are now!! So, can you afford $6.00 and see if it really works?? I think =
so... People have said, "what if the plan is played out and no one sends =
you the CASH? So what! What are the chances of that happening when there =
are tons of new honest users and new honest people who are joining the =
internet and newsgroups everyday and are willing to give it a try? =
Estimates are at 20,000 to 50,000 new users, every day, with thousands =
of those joining the actual internet. Remember, play FAIRLY and HONESTLY =

```
and this will really work.=20

: ** By the way, if you try to deceive people by posting the messages =
with your name in the list and not sending the CASH to the rest of the =
people already on the list, you will NOT get as much. Someone I talked =
to knew someone who did that and he only made about $150.00, and that's =
after seven or eight weeks! Then he sent the 6 $1.00 bills, people added =
him to their lists, and in 4-5 weeks he had over $10k. This is the =
fairest and most honest way I have ever seen to share the wealth of the =
world without costing anything but our time!!! You also may want to buy =
mailing and e-mail lists for future CASH.=20

: Remember, HONESTY IS THE BEST POLICY. You don't need to cheat, the =
basic idea is to make the CASH!! GOOD LUCK to all and please play fairly =
and reap the huge rewards from this, which is tons of extra CASH. Keep =
an eye on the newsgroups and when the cash has stopped coming (that =
means your name is no longer on the list), you just take the latest =
posting at the newsgroups, send another $6.00 to the names stated on the =
list, make your corrections (put your name at #6) and start posting =
again.=20

: $$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!=20

: GOOD LUCK!!!=20

<DIV><FONT face=3DArial=20
size=3D2>________________________________________________________________=
_____________________<BR>Attention!!=20
This is not a scam, this is the real deal--this is money in your=20
pocket!<BR>Note:&nbsp; I made the $6 leap of faith and it is paying off =
big=20
time!&nbsp; You should too.<BR>Just read what is below and see for=20
yourself.&nbsp; This will change your life:</FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2><BR>$6 Investment to make =
$1000s</FONT></DIV>
```

```
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2><BR>: Make A Lot Of Money Fast =
!!!!!</FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: <BR>: A while back, I was browsing =
newsgroups,=20
just like you, I came across an article similar to this that said you =
could make=20
thousands of CASH within weeks with only an initial investment of $6.00 =
plus=20
stamps! So I thought, "Yeah, right, this must be a scam!" But like most =
of us I=20
was curious and kept reading. It said that if you send $1.00 to each of =
the 6=20
names and addresses listed in the article, you could make thousands in a =
very=20
short period of time. You then place your own name and address at the =
bottom of=20
the list at #6, and post the article to at least 300 newsgroups. (There =
are=20
about 32,000 of them out there and that's quite a large market pool). No =
catch,=20
that was it. Even though the investment was a measly $6, I had three =
questions=20
that needed to be answered before I could get involved in this sort of =
thing.=20
</FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: 1. IS THIS REALLY LEGAL? I called a =
lawyer first.=20
The lawyer was a little sceptical that I would actually make any CASH =
but he=20
said it WAS LEGAL if I wanted to try it. I told him it sounded a lot =
like a=20
chain letter but the details of the system (SEE BELOW) actually made it =
a=20
legitimate legal business. </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: 2. IS OK WITH THE POST OFFICE OR IS =
IT MAIL=20
FRAUD? I called them: 1-800-725-2161 and they confirmed THIS IS =
ABSOLUTELY=20
LEGAL! (See 18, h sections1302 NS 1341 of Postal Lottery Laws). This =
clarifies=20
the program of collecting names and addresses for a mailing list. =
</FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: 3. IS IT RIGHT? Well, everyone who =
sends me a=20
buck has a good chance of getting A LOT of CASH ... a much better chance =
than=20
buying a lottery ticket!!! So, having these questions answered, I =
invested=20
```

```
EXACTLY $7.92 ... six $1.00 bills and six 32 cent postage stamps ... and =
boy am=20
I glad I did!!! Within 7 days, I started getting CASH in the mail! I was =

shocked! I figured it would end soon and didn't give it another thought. =
But the=20
CASH continued coming in. In my first week I made between $20 to $30. By =
the end=20
of the second week I had a made a total of $1,000.00. In the third week =
I had=20
over $10,000.00 and it was still growing. This is now my fourth week and =
I have=20
made a total of just over $42,000 and it's still coming in... =
</FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: It's certainly worth $6.00 and 6 =
stamps !!! Also,=20
make sure you print a copy of this article NOW, so you can get the =
information=20
off of it as you need it. I promise you that if you follow the =
directions=20
exactly, that you will start making more CASH than you thought possible =
by doing=20
something so easy! Suggestion: Read this entire message carefully! =
(print it out=20
or download it.) Follow the simple directions and watch the CASH come =
in! It's=20
easy. It's legal. And, your investment is only $6.00 (Plus postage) =
IMPORTANT:=20
This is not a rip-off; it is not indecent; it is not illegal; and it is=20
virtually no risk - it really works!!!! If all of the following =
instructions are=20
adhered to, you will receive extraordinary dividends. </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: PLEASE NOTE: Please follow these =
directions=20
EXACTLY, and $50,000 or more can be yours in 20 to 60 days. This program =
remains=20
successful because of the honesty and integrity of the participants. =
Please=20
continue its success by carefully adhering to the instructions. You will =
now=20
become part of the Mail Order business. In this business your product is =
not=20
solid and tangible, it's a service. You are in the business of =
developing=20
Mailing Lists. Many large corporations are happy to pay big bucks for =
quality=20
lists. However, the CASH made from the mailing lists is secondary to the =
income=20
which is made from people like you and me asking to be included in that =
list.=20
</FONT></DIV>
```

```
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: Here are the 4 easy steps to success: =

</FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: STEP 1: Get 6 separate pieces of =
paper and write=20
the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING =
LIST." Now=20
get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of paper =
so the=20
bill will not be seen through the envelope (to prevent thievery). Place =
one=20
paper in each of the 6 envelopes and seal them. You should now have 6 =
sealed=20
envelopes, each with a piece of paper stating the above phrase, your =
name and=20
address, and a $1.00 bill. What you are doing is creating a service. =
THIS IS=20
ABSOLUTELY LEGAL! You are requesting a legitimate service and you are =
paying for=20
it! Like most of us I was a little skeptical and a little worried about =
the=20
legal aspects of it all. So I checked it out with the U.S. Post Office=20
(1-800-725-2161) and they confirmed that it is indeed legal! Mail the 6=20
envelopes to the following addresses: </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: <BR>: </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: #1) Aditya Venkataraman 14215 Lake =
Trail Driv=20
Sugar Land, Texas 77478 </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: #2) Charlie Baltimore 71-20 Sutton =
Place #3 Fresh=20
Meadows, NY 11365 </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: #3) Shaun Littman 3061 Clubhouse Road =
Merrick,=20
N.Y. 11566 </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: #4) Joseph Morris P.O. Box 37 Union =
Grove, Al=20
35175 </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: #5) M. Dixon P.O. Box 767412 Roswell, =
GA=20
30076</FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: #6) Lee Higginbotham&nbsp; 8505 =
Columbus Ave.=20
#209 North Hills, CA 91343<BR>: <BR>: STEP 2: Now take the #1 name off =
the list=20
```

```
that you see above, move the other names up (6 becomes 5, 5 becomes 4, =
etc...)=20
and add YOUR Name as number 6 on the list. DO NOT JUST COPY OVER THE =
LAST NAME,=20
BUT REMEMBER TO MOVE EACH NAME UP ONE LINE!!!!!!!! </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: STEP 3: Change anything you need to, =
but try to=20
keep this article as close to original as possible. Now, post your =
amended=20
article to at least 300 newsgroups. (I think there are close to 32,000 =
groups)=20
All you need is 300, but remember, the more you post, the more CASH you =
make!=20
</FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: This is perfectly legal! If you have =
any doubts,=20
refer to 18 Sec. 1302 &amp; 1341 of the Postal lottery laws. Keep a copy =
of=20
these steps for yourself and, whenever you need CASH, you can use it =
again, and=20
again. </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: PLEASE REMEMBER that this program =
remains=20
successful because of the honesty and integrity of the participants and =
by their=20
carefully adhering to the directions. Look at it this way. If you are a =
person=20
of integrity, the program will continue and the CASH that so many others =
have=20
received will come your way. </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: NOTE: You may want to retain every =
name and=20
address sent to you, either on a computer or hard copy and keep the =
notes people=20
send you. This VERIFIES that you are truly providing a service. (Also, =
it might=20
be a good idea to wrap the $1 bill in dark paper to reduce the risk of =
mail=20
theft.) So, as each post is downloaded and the directions carefully =
followed,=20
six members will be reimbursed for their participation as a List =
Developer with=20
one dollar each. Your name will move up the list so that when your name =
reaches=20
the #1 position you will be receiving thousands of DOLLARS in CASH!!! =
What an=20
opportunity for only $6.00. Send it now, add your own name to the bottom =
of the=20
list and you're in business! </FONT></DIV>
```

```
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: ---DIRECTIONS ----- FOR HOW TO POST =
TO NEWSGROUPS=20
</FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: Step 1) You do not need to re-type =
this entire=20
letter to do your own posting. Simply put your cursor at the beginning =
of this=20
letter and drag your cursor to the bottom of this letter, and select =
'copy' from=20
the edit menu. This will copy the entire letter into the computer's =
memory.=20
</FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: Step 2) Open a blank 'notepad' file =
and place=20
your cursor at the top of the blank page. From the 'edit' menu select =
'paste'.=20
This will paste a copy of the letter into notepad so that you can add =
your name=20
to the list. </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: Step 3) Save your new notepad file as =
a .txt=20
file. If you want to do your postings in different settings, you'll =
always have=20
this file to go back to. </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: Step 4) Use Netscape or Internet =
explorer and try=20
searching for various newsgroups (on-line forums, message boards, chat =
sites,=20
discussions.) </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: Step 5) Visit these message boards =
and post this=20
article as a new message by highlighting the text of this letter and =
selecting=20
paste from the edit menu. Fill in the Subject, this will be the header =
that=20
everyone sees as they scroll through the list of postings in a =
particular group,=20
click the post message button. </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: You're done with your first one!=20
Congratulations...THAT'S IT! All you have to do is jump to different =
newsgroups=20
and post away, after you get the hang of it, it will take about 30 =
seconds for=20
each newsgroup! </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: **REMEMBER, THE MORE NEWSGROUPS YOU =
POST IN, THE=20
MORE CASH YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 300** That's =
it! You=20
will begin receiving CASH from around the world within days! You may =
eventually=20
want to rent a P.O.Box due to the large amount of mail you will receive. =
If you=20
wish to stay anonymous, you can invent a name to use, as long as the =
postman=20
will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.** =
</FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: Now the WHY part: </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: Out of 300 postings, say I receive =
only 7 replies=20
(a very low example). So then I made $7.00 with my name at #6 on the =
letter.=20
Now, each of the 7 persons who just sent me $1.00 make the MINIMUM 300 =
postings,=20
each with my name at #5 and only 7 persons respond to each of the 7 =
original 7,=20
that is another $49.00 for me, now those 49 each make 300 MINIMUM posts =
with my=20
name at #4 and only 7 replies each, I will bring in an additional =
$343.00! Now,=20
those 343 persons turn around and post the MINIMUM 300 with my name at =
#3 and=20
only receive 7 replies each, I will make an additional $2401.00! OK, now =
here is=20
the fun part, each of those 2401 persons post a MINIMUM 300 letters with =
my name=20
at #2 and they each only receive 7 replies, that just made me =
$16,807.00!!!=20
Those 16807 persons will all deliver this message to 300 newsgroups with =
my name=20
at #1 and if still 7 persons per 300 Newsgroups react I will receive=20
$117,649.00! With an original investment of only $6.00! And some stamps. =

AMAZING! When your name is no longer on the list, you just take the =
latest=20
posting in the newsgroups, and send out another $6.00 to names on the =
list,=20
putting your name at number 6 again. And start posting again. =
</FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: The thing to remember is: Thousands =
of people all=20
over the world are joining the internet and reading these articles =
everyday?=20
JUST LIKE YOU are now!! So, can you afford $6.00 and see if it really =
works?? I=20
think so... People have said, "what if the plan is played out and no one =
sends=20
you the CASH? So what! What are the chances of that happening when there =
are=20
tons of new honest users and new honest people who are joining the =
internet and=20
newsgroups everyday and are willing to give it a try? Estimates are at =
20,000 to=20
50,000 new users, every day, with thousands of those joining the actual=20
internet. Remember, play FAIRLY and HONESTLY and this will really work.=20
</FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: ** By the way, if you try to deceive =
people by=20
posting the messages with your name in the list and not sending the CASH =
to the=20
rest of the people already on the list, you will NOT get as much. =
Someone I=20
talked to knew someone who did that and he only made about $150.00, and =
that's=20
after seven or eight weeks! Then he sent the 6 $1.00 bills, people added =
him to=20
their lists, and in 4-5 weeks he had over $10k. This is the fairest and =
most=20
honest way I have ever seen to share the wealth of the world without =
costing=20
anything but our time!!! You also may want to buy mailing and e-mail =
lists for=20
future CASH. </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: Remember, HONESTY IS THE BEST POLICY. =
You don't=20
need to cheat, the basic idea is to make the CASH!! GOOD LUCK to all and =
please=20
play fairly and reap the huge rewards from this, which is tons of extra =
CASH.=20
Keep an eye on the newsgroups and when the cash has stopped coming (that =
means=20
your name is no longer on the list), you just take the latest posting at =
the=20
newsgroups, send another $6.00 to the names stated on the list, make =
your=20
corrections (put your name at #6) and start posting again. </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>:=20
$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!!$$$!!! </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>: GOOD LUCK!!! </FONT></DIV>
<DIV>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2></FONT>&nbsp;</DIV>
<DIV>&nbsp;</DIV>

I seem to remember seeing an article some time ago that talked about using phone modems on HF for RTTY, AMTOR, etc. I have not been able to find any information on the subject, and was hoping someone else had heard of this and could point me in the right direction. I have a couple of Hayes 2400 modems that can be set for the old Bell 300 / 1200 baud modes, and am in the mood to experiment :) Thanks!

Weather data is pretty common, but any number of other data items - not just lat/long. Maybe you want to send your mobile station some info about your fixed station (i.e, "you have mail" - mail you don't need while mobile, "your house is on fire"). The position info is not the "real" payload, and there is really no limit to what the payload could be (well, stock quotes would be a bad idea ;-)

> Maybe there's a real need there, that I'm having trouble seeing. If there
> is, don't worry about it. Lots of unattended VHF/UHF Packet stations
> transmit, and I've never heard of anyone getting into a crack over it.

Just re-read Steve's last sentence one more time. Charlie obviously didn't.

I would hope that if APRS applications do start popping up on 70cm,
that folks would standardize on one frequency, and standardize on
9600bps.

It will be harder to standardize on a UHF nationwide frequency, because
there isn't even a single standard UHF 9600bps coordinated frequency
yet. I think the ARRL came up with some "suggested" ones in the early
90's - but they weren't any good for the Southern California area,
because of the Pt. Mugu radar problem.

If the mod doesn't allow all users on the channel to run with low TxDelay settings(on the order of 5-8) - then don't bother, as you won't be able to "play with the others" on the channel. Besides, with high TxDelay settings, your thruput won't be significantly better than at 120bps.

Get a dedicated data radio. TEKKs are good, and cheap.

"D. Stussy" appears to be unhappy that I recently pointed out his anti-ham LandLine Lid rhetoric, and considers my doing so to be an "unprovoked, personal attack"...

Is he related to Bill Clinton, I wonder?

Then I pointed out the fact that Steve, for all his pretended respect for the rules, is one of those LandLine Lids who thinks that we should use Amateur Packet Radio as a way to provide Internet access, despite the fact that doing so would most certainly lead to illegal content being transmitted over the Ham bands. - Another "unprovoked, personal attack ", D. Stussy claims.

Maybe he's related to "Hillary"?

;-)

LandLine Lids such as Steve and D. Stussy "provoke" me to point out their anti-Ham activities... This is no "attack"... If they are ashamed of what they are doing and feel "attacked" when it's pointed out, perhaps they should consider modifying their behavior.

D. Stussy calls me "Mr. CB", but it's him and those of his ilk who have been indulging in anti-Ham behavior, not me. Perhaps he should give THAT a bit of thought as well. - If he's up to the job.

It's not a scam... Just a felony.

So... You don't think this is illegal huh?

By the way here's what the US postal inspector's office says about it.

A chain letter is a "get rich quick" scheme that promises that your mail box will soon be stuffed full of cash if you decide to participate. You're told you can make thousands of dollars every month if you follow the detailed instructions in the letter.

A typical chain letter includes names and addresses of several individuals whom you may or may not know. You are instructed to send a certain amount of money--usually $5--to the person at the top of the list, and then eliminate that name and add yours to the bottom. You are then instructed to mail copies of the letter to a few more individuals who will hopefully repeat the entire process. The letter promises that if they follow the same procedure, your name will gradually move to the top of the list and you'll receive money -- lots of it.

There's at least one problem with chain letters. They're illegal if they request money or other items of value and promise a substantial return to the participants. Chain letters are a form of gambling, and sending them through the mail (or delivering them in person or by computer, but mailing money to participate) violates Title 18, United States Code, Section 1302, the Postal Lottery Statute. (Chain letters that ask for items of minor value, like picture postcards or recipes, may be mailed, since such items are not things of value within the meaning of the law.)

Recently, high-tech chain letters have begun surfacing. They may be disseminated over the Internet, or may require the copying and mailing of computer disks rather than paper. Regardless of what technology is used to advance the scheme, if the mail is used at any step along the way, it is still illegal.

The main thing to remember is that a chain letter is simply a bad investment. You certainly won't get rich. You will receive little or no money. The few dollars you may get will probably not be as much as you spend making and mailing copies of the chain letter.

Chain letters don't work because the promise that all participants in a chain letter will be winners is mathematically impossible. Also, many people participate, but do not send money to the person at the top of the list. Some others create a chain letter that lists their name numerous times -- in various forms with different addressee. So, in reality, all the money in a chain is going to one person.

Do not be fooled if the chain letter is used to sell inexpensive reports on credit, mail order sales, mailing lists, or other topics. The primary purpose is to take your money, not to sell information. "Selling" a product does not ensure legality. Be doubly suspicious if there's a claim that the U.S. Postal Service or U.S. Postal Inspection Service has declared the letter legal. This is said only to mislead you. Neither the Postal Service nor Postal Inspectors give prior approval to any chain letter.

Well, I don't claim to be an expert on APRS, but it does appear to be the case that APRS is really intended to run a "context" on one frequency regardless of the geographical area or number of users covered. Isolated "contexts" can exist, if you're just interested in a sub-set of users.

The protocol *seems* to attempt to scale to larger areas or number of users by adaptive timeouts rather than a architecture of gateways or proxies. I tend to question the capability of this approach myself, but I'm not an expert. Perhaps I should have a closer look.

So, in the context of a nationwide APRS context, a single frequency makes sense, but there's no reason why regional frequencies could be used for sub-sets of the nationwide context.

> It will be harder to standardize on a UHF nationwide frequency, because there isn't even a single standard UHF 9600bps coordinated frequency yet.

This doesn't make much sense to me. It didn't seem all that easy to move APRS to 144.39MHz just because they'd set up camp elsewhere. So, I tend to disagree.

> I think the ARRL came up with some "suggested" ones in the early 90's - but they weren't any good for the Southern California area, because of the Pt. Mugu radar problem.

Is APRS really *that* old that the ARRL would have proposed nationwide frequencies in the early 1990s? I think APRS itself was only hatched around 1992. OK, enough of the hair-splitting.

Pt. Mugu is only one of many areas in SoCal plaugued by primary users of the UHF band (of which amateurs are secondary users). Edwards AFB and Palmdale Plant 42 frequently encounter RADAR interference - the only thing that's made RADAR interference better is the number of base-closings during the 1990s.

I tend to suspect almost any location in the United States has local RADAR often enough to notice.

When a couple of us here locally wanted to experiment with 9600 when Gracilis came out with their card we set up on a frequency down in the 430 range. This turned out to be a bad idea, as none of the dual-band Omni's like Diamond and Comet had any gain down there. We started out using beams, but found cheap Omni's with mucho gain didn't work down there.

Anyway, if you do start something up, I would try to keep it in the 445 - 446 area. We have a 1200 baud freq of 446.775 in most of OK which was used for BBS backbone back in its big days.

I think contacting a coordinator was a good suggestion, as they will know the unpublished aux links, and help you from causing a big stink. Even then I would put a recorder on the freq for a few days (I use one of those radio-shack recorders that record when the squelch breaks (get to hear the cops for a whole day in 15 minutes, ha), as there may be an un-coordinated Ham doing their thing right smack dab where you want to do your thing.

I think it's mostly a Navy thing anymore. The USAF has pretty much
abandoned the UHF band for radar, other than some of the missile
detection systems (which I hear have been mothballed mostly). More
likely to find wind profilers from the Weather Service than a pulse radar :-)

I think the E-2 Hawkeye can do 460 MHz, I don't know about lower, but
we hardly see them around here anymore. The nearest radar to me is a
 1.2 GHz FAA Long Range Radar (LRR) about 4 miles east, and the rest
are S band around here.

I have two handheld radios for sale. Both are Alinco DJ-195 handhelds and transmit on amateur radio two-meter frequencies, which is 144 to 148 MHz. They transmit at 5 watts, and have worked on simplex at a little over five miles. Using a repeater you gain substantially more range. Both come with speaker microphones as well as surveillance microphones. They come with two wall chargers, one car charger and a suction cup antenna mount for use inside your car. Keep in mind you need an amateur radio license to transmit on two-meter frequencies. I'll sell the whole package for $300 plus shipping.

You can view the radio and specs at:

http://www.alinco.com/Products/DJ-195

Also have a Radio Shack scanner for sale. Works with trunked systems, and scans from 29 MHz to 900Mhz. Cellular frequencies are blocked. Will sell it, plus two rechargable battery packs, for $100 plus shipping.

If you're interested, please e-mail me at wellsa@conceptsnet.com or call (206) 222-7521.

Thanks.

1) Very interesting that "Mr. CB" classifies me as a "LLL" although I have NEVER passed any radio origined or destined traffic via any wireline connection. I don't even run a packet BBS (but I have used them - and those which I have used don't forward over the phone lines).

2) Also interesting that he objects to being called "Mr. CB" even though C followed by B are his initials of his true name.

3) Note that I did NOT say that you personally attacked ME. I simply stated that your only contribution on the subject was to attack someone else. Go back to trollville.

Note that here in Southern California, the entire 440-450MHz segment, except
for about 4 pairs, are coordinated to repeaters. Out of those 8 frequencies
which are not, only one is allocated to any digital mode (and it is used for
BBS mail forwarding only).

The "socal" digital allocations are at 431 MHz and 439 MHz.

As for antennas, Comet and Diamond do make antennas that are resonant in the
435 MHz range, but one has to order them with a slightly adjusted part number.
Using the normal part number will result in an antenna centered around 445 MHz,
as you found out.

Lastly, although some people may be uncoordinated, I believe you meant to refer
to an uncoordinated radio operation, not the person, unless you were referring
to a specific situation. ;-)

For years, the radar planes sent out to interdict drug smugglers have regularly trashed out the 440 MHz 9.6kb "backbone" links of the TexNet Packet network, from central Texas, all the way down to the border. (300 mi. footprint affected) Why the TexNet folks used 440Mhz for their backbone links in the first place, then continued to put new ones in after this problem came up is hard to understand. SEDAN does just fine with their 6-meter 9.6kb backbone, with no comparable interference problems. Other nets do just fine, using the 220 MHz stuff.

I was referring to 9600bps frequencies - this should have been obvious
contextually as well as grammatically.

The Southern California area is one of a few that was "specifically" referred to in older editions of the Part 97 FCC rules. There were others - i.e., there was one area centered in Eastern New Mexico(White Sands). I think the FCC has deleted many of the specific geographic references. My FCC manual is old enough that it still has them. In any event, we are "secondary" on 420-430, and this part of the 70cm band gets "blasted" in SoCal. I'm sure it gets hit in other parts of the country as well. My point is - the frequencies that this old ARRL article tried to coordinate for packet were in this "bad" area. The net result is that there are NO useful coordinated standard 9600bps or higher 70cm frequencies in the US. Pretty ridiculous.

By the way, we've standardized on frequencies around 439.000 in SoCal. I think there were 438.950, 438.975, 439.000, 439.025, 439.050. If you were getting a TEKK radio crystal cut - 439.025 was your best bet.

I was on 439.025 for a long time with a Flexar; just couldn't hear too much activity out in the boonies - in fact, I think I can enumerate every station that ever regularly emitted a 9k6 peep out in the Antelope Valley on one hand, and we were all on 439.025.

The TEKK radios are neat enough for a metropolitan area context but were not particularly effective over the relatively long distances we had to deak with. Land mobiles were really required.

Does anyone have recommendations for crystal suppliers for TEKK radios?

I once read an adendum in the back of a Hayes manual that gave the proper
command sequences to use the 1200 baud mode to send ascii on the air. It
even showed how to use the "on hook" relay to key the transmitter!

I am sure I threw it out ten years ago, but it was in the back of a hays

```
book for an external modem.

Good Luck!

KA9CAR

The rules state you must be "in control" of your station(s).

I suppose you could have 20 or 30 stations if you like...as long as
you can control them somehow.

...But remember that "automatic control" is control, and it is allowed for
digital modes above 50 MHz  (47 CFR 97.109(d)).

Being new to APRS I would like not to make too many mistakes so I have another question. I have been experimenting with street level tracking using APRS+SA at my home qth and a TM-D700 in a vehicle. I live in mountainous terrain and the path from the mobile ranges from excellent on top of hills and mountains to nonexistent in low areas. In order to get as much detail as possible I have been keeping the auto beacon function on the D700 at 1 minute in rough terrain. My question is what is an appropriate transmission interval that will allow me to get decent tracking resolution but not waste bandwidth on the APRS system. Is there any established protocol like 1 transmission every X minutes or is it sort of a free form thing left up to the operator.

Thanks for the help on my previous question es 73

A while ago, I whined and moaned that my PacComm PacTOR controller became useless, since I was unable to check into the WinLink 2000 HF/Internet Gateways. The 'new' systems required Airmail Software, which didn't support my TNC. This put me off, especially since my unit was excluded, yet it conformed to the PTC-1 protocol, which was the backbone of ALL the later advancements.

I recently found that Jim (KE6RK) of the Aimail Software, HAD listened to me and patched his program to include the PTC-1 and PacComm PacTOR Controller into the useable drivers for his system.

I used his system for a recent 5 day camping trip and it worked GREAT!

I was able to keep in touch with my wife at home twice a day with no problems using the HF Xcvr (Why I would want to - that's another story!)

I was North of Parry Sound Ontario (250M N of Toronto) and regularly cleared my traffic with K4CJX and N0ZO, usually - although N8PGR and VE1(?) were also used.

Gang - this is a GOOD system.

Airmail2000
Winlink

Look them up, check them out, and use them.

I apologize for some of my previous venom! (However, if there are programmers who want to get Mac, Linux, Palmtops, etc., to work - you better offer to help!)

A good system will adapt the rate of transmissions to the movement of the vehicle. I.e. when the vehicle is moving slow it will transmit less frequently than when it is moving fast. You can then set it to "transmit

```
every Y minutes or when the position has moved a distance more than Y
from the previously transmitted position".

It is also possible to listen to re-transmissions via a digipeater.
When it hears back re-transmissions of its own beacons it should transmit
less frequently than when it does not hear such re-transmissions.

I don't know what is written in the USA regulations, but from the above it
```

seems to me that there is a potential confusion about what "control" really means.

I can think of "automatic control" meaning that an automated system is somehow controlling the switching on/off of the transmitter (as it is done on packet: the AX.25 software completely automatically controls the transmitter, independently from what the operator types or does). This would be different from "manual control" e.g. with a voice transmitter that keys when you push a PTT button.
With packet, there is "automatic control" even when the operator is present, in this definition.

I can also think of "automatic control" meaning a completely autonomous system being completely automatically run. Like a repeater, packet BBS, APRS station with weather data.

The important point probably is (it would have been here, until the governing bodies lost all interest in what is happening inside the bands) "are in control of your station in case it misbehaves".
They should be able to contact you (at your station address or telephone number) and you should then be able to control the station (turn it off when it causes interference or operates/is being operated beyond the limits specified in the license). When you can do that, you are "in control" of your station. But most mobile APRS users with a station at home left unattended probably can't.

I was thinking about writing an RTTY modem for Linux, using the sound card (/dev/audio) interface (since I can't seem to find something like this out there). Not being a DSP guru, I'd like to present some thoughts..

1. Detector
   I guess the approach with adding the input signal with predefined waveforms (0 and 90 degrees for each of the two frequencies), and then passing it through an integrate-and-dump (as described in Tom McDermott's book) is ok ?

   What would be a suitable integration time? 8 integrations pr. bit, perhaps? (to allow for adjusting to match edges better)

2. Decoder
   One alternative is to shift the detector output into a shift-register, and look for something that matches a valid Baudot character.
   Are there better methods ?

Any comments?

Dear Friend,

This really works! Have the faith, don't miss this opportunity, get involved also, and it will work for you as it does for us!!!!!

Thank you for your time and interest.

This email contains the ENTIRE PLAN of how YOU can make $50,000 or more in the next 90 days simply sending email!

Seem impossible? Just read on and see how easy this is....

Due to the popularity of this letter on the Internet, a major nightly news program recently devoted an entire show to the investigation of the program described below to see if it really can make people money.

The show also investigated whether or not the program was legal. Their findings proved that there are absolutely no laws prohibiting participation in the program. This has helped to show people that this is a simple, harmless and fun way to make some extra money at home.

The results have been truly remarkable. So many people are participating

that those involved are doing much better than ever before. Since everyone makes more as more people try it out, its been very exciting.

You will understand once you try it yourself!

********* THE ENTIRE PLAN IS HERE BELOW *********

*** Print This Now For Future Reference ***

$$

If you would like to make at least $50,000 in less than 90 days, please read this program...THEN READ IT AGAIN!!

$$

THIS IS A LEGITIMATE, LEGAL, MONEY MAKING OPPORTUNITY!!

It does NOT require you to come into contact with people or make or take any telephone calls. Just follow the instructions, and you will make money. This simplified e-mail marketing program works perfectly 100% EVERY TIME!

E-mail is the sales tool of the future. Take advantage of this virtually

free method of advertising NOW!!! The longer you wait, the more people will be doing business using email. Get your piece of this action!!!

~~~~~~

Hello - My name is Johnathon Rourke, I'm from Rhode Island.

The enclosed information is something I almost let slip through my fingers. Fortunately, sometime later I re-read everything and gave some thought and study to it. Two years ago, the corporation I worked for for

the past twelve years down-sized and my position was eliminated. After unproductive job interviews, I decided to open my own business. Over the

past year, I incurred many unforeseen financial problems. I owed my family, friends and creditors over $35,000. The economy was taking a toll on my business and I just couldn�t seem to make ends meet. I
~~~~~~

had to refinance and borrow against my home to support my family and struggling business.

AT THAT MOMENT something significant happened in my life. I am writing toshare the experience in hopes that this could change your life FOREVER. FINANCIALLY$$$!!!

In mid December, I received this program in my e-mail. Six months prior to receiving this program I had been sending away for information on various business opportunities. All of the programs I received, in my opinion, were not cost effective. They were either too difficult for me to comprehend or the initial investment was too much for me to risk to see if they would work. But as I was saying, in December of 1997 I received this program. I didn�t send for it, or ask for it, they just got my name off a mailing list.

THANK GOODNESS FOR THAT!!! After reading it several times, to make sure I was reading it correctly. I couldn�t believe my eyes! Here was a MONEY MAKING MACHINE I could start immediately without any debt.

Like most of you I was still a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161 24-hrs) and they confirmed that it is indeed legal!

After determining the program was LEGAL I decided "WHY NOT!?!??"

Initially I sent out 10,000 e-mails. It cost me about $15 for my time on-line. The great thing about e-mail is that I don�t need any money for

printing to send out the program, and because I also send the product (reports) by e-mail, my only expense is my time.

In less than one week, I was starting to receive orders for REPORT #1. By January 13, I had received 26 orders for REPORT #1. Your goal is to "RECEIVE at least 20 ORDERS FOR REPORT #1 WITHIN 2 WEEKS. IF YOU DON�T, SEND OUT MORE PROGRAMS UNTIL YOU DO.

My first step in making $50,000 in 90 days was done. By January 30, I had received 196 orders for REPORT #2. Your goal is to "RECEIVE AT LEAST 100+ ORDERS FOR REPORT #2 WITHIN 2 WEEKS. IF NOT, SEND OUT MORE

PROGRAMS UNTIL YOU DO. ONCE YOU HAVE 100 ORDERS, THE REST IS EASY, RELAX, YOU WILL MAKE YOUR $50,000 GOAL."

Well, I had 196 orders for REPORT #2, 96 more than I needed. So I sat back and relaxed. By March 1, of my e-mailing of 10,000, I received $58,000 with more coming in every day. I paid off ALL my debts and bought a much needed new car!

Please take your time to read this plan, IT WILL CHANGE YOUR LIFE FOREVER$!!! Remember, it won�t work if you don�t try it. This program does work, but you must follow it EXACTLY!

Especially the rules of not trying to place your name in a different place.
It won�t work and you�ll lose out on a lot of money! In order for this program to work, you must meet your goal of 20+ orders for REPORT #1, and 100+ orders for REPORT #2 and you will make $50,000 or more in 90 days.

I AM LIVING PROOF THAT IT WORKS!!! If you choose not to participate in this program, I am sorry. It really is a great opportunity with little cost or risk to you. If you choose to participate, follow the program and you will be on your way to financial security. If you are a fellow business owner and are in financial trouble like I was, or you want to start your own business, consider this a sign. I DID! $$

Sincerely,

Johnathon Rourke
~~~~~~

A PERSONAL NOTE FROM THE ORIGINATOR OF THIS PROGRAM:

By the time you have read the enclosed program and reports, you should have concluded that such a program, and one that is legal, could not have been created by an amateur. Let me tell you a little about myself. I had a profitable business for 10 years. Then in 1979 my business began falling off. I was doing the same things that were previously successful for me, but it wasn�t working. Finally, I figured it out. It wasn�t me, it was the economy. Inflation and recession had replaced the stable economy that had been with us since 1945.

I don�t have to tell you what happened to the unemployment rate...because many of you know from first hand experience. There were more failures and bankruptcies than ever before. The middle class was vanishing.
Those who knew what they were doing invested wisely and moved up. Those who did not, including those who never had anything to save or invest, were moving down into the ranks of the poor. As the saying goes, "THE RICH GET RICHER AND THE POOR GET POORER." The traditional methods of making money will never allow you to "move up" or "get rich." Inflation will see to that.

You have just received information that can give you financial freedom for the rest of your life, with "NO RISK" and "JUST A LITTLE BIT OF EFFORT." You can make more money in the next few months than you have ever imagined. I should also point out that I will not see a penny of this money, nor anyone else who has provided a testimonial for this
~~~~~~

program.

I have retired from the program after sending thousands and thousands of programs. Follow the program EXACTLY AS INSTRUCTED. Do not change it in any way. It works exceedingly well as it is now. Remember to e-mail a copy of this exciting report to everyone you can think of. One of the people you send this to may send out 50,000...and your name will be on every one of them! Remember though, the more you send out, the more potential customers you will reach. So my friend, I have given you the ideas, information, materials and opportunity to become financially independent.

IT IS UP TO YOU!! NOW DO IT!!

~~~~~~

Before you delete this program from your in box, as I almost did, take a little time to read it and REALLY THINK ABOUT IT. Get a pencil and figure out what could happen when YOU participate. Figure out the worst possible response and no matter how you calculate it, you will still make a lot of money! You will definitely get back what you invested. Any doubts you have will vanish when your first orders come in.

$$$ IT WORKS!!! $$$

Jody Jacobs Richmond, VA

~~~~~~

HERE�S HOW THIS AMAZING PROGRAM WILL MAKE YOU THOUSANDS OF DOLLAR$$$$!!!!

This method of raising capital REALLY WORKS 100% EVERY TIME. I am sure that you could use up to $50,000 or more in the next 90 days. Before you say "BULL... ", please read this program carefully. This is not a chain letter, but a perfectly legal money making business.

As with all multi-level businesses, we build our business by recruiting new partners and selling our products. Every state in the USA allows you to recruit new multi-level business partners, and we sell and deliver a product for EVERY dollar received.

YOUR ORDERS COME BY MAIL AND ARE FILLED BY E-MAIL, so you are not involved in personal selling. You do it privately in your own home, store or office. This is the EASIEST marketing plan anywhere! It is simply order-filling by email!

****

The product is informational and instructional material, keys to the secrets for everyone on how to open the doors to the magic world of E-COMMERCE, the information highway, the wave of the future!

PLAN SUMMARY:

(1) You order the 4 reports listed below ($5 US each.) They come to you by email.

(2) Save a copy of this entire letter and put your name after Report #1 and move the other names down.

(3) Via the internet, access Yahoo.com or any of the other major search engines to locate hundreds of bulk email service companies (search for "bulk email") and have them send 25,000 - 50,000 emails for you about $49+).

(4) Orders will come to you by postal mail - simply email them the Report they ordered. Let me ask you - isn�t this about as easy as it gets?

****

By the way there are over 50 MILLION email addresses with millions more joining the internet each year so don�t worry about "running out" or "saturation". People are used to seeing and hearing the same advertisements every day on radio/TV. How many times have you received the same pizza flyers on your door? Then one day you are hungry for pizza and you order one. Same thing with this letter. I received this letter many times - then one day I decided it was time to try it.

****

YOU CAN START TODAY - JUST DO THESE EASY STEPS:

STEP #1. ORDER THE FOUR REPORTS

Order the four reports shown on the list below (you can�t sell them if you don�t order them). -- For each report, send $5.00 (US) CASH, the NAME & NUMBER OF THE REPORT YOU ARE ORDERING, YOUR E-MAIL ADDRESS, and YOUR NAME & RETURN ADDRESS (in case of a

problem) to the person whose name appears on the list next to the report.
MAKE SURE YOUR RETURN ADDRESS IS ON YOUR ENVELOPE IN CASE OF ANY MAIL PROBLEMS! Within a few days you will receive, by e-mail, each of the four reports. Save them on your computer so you can send them to the 1,000�s of people who will order them from you.

STEP #2. ADD YOUR MAILING ADDRESS TO THIS LETTER

a. Look below for the listing of the four reports.
b. After you�ve ordered the four reports, delete the name and address under REPORT #4. This person has made it through the cycle.
c. Move the name and address under REPORT #3 down to REPORT #4.
d. Move the name and address under REPORT #2 down to REPORT #3.
e. Move the name and address under REPORT #1 down to REPORT #2.
f. Insert your name and address in the REPORT #1 position.
Please make sure you COPY ALL INFORMATION, every name and address, ACCURATELY!

STEP #3. SAVE THIS LETTER

Take this entire letter, including the modified list of names, and save it to your computer. Make NO changes to these instructions. Now you are ready to use this entire email to send by email to prospects.

Report #1 will tell you how to download bulk email software and email addresses so you can send it out to thousands of people while you sleep!

Remember that 50,000+ new people are joining the internet every month.

Your cost to participate in this is practically nothing; surely you can afford $20 (US) and initial bulk mailing cost. You obviously already have a computer and an Internet connection and e-mail is FREE!

There are two primary methods of building your downline:

METHOD #1: SENDING BULK E-MAIL Let�s say that you decide to start small,

just to see how it goes, and we�ll assume you and all those involved email out only 2,000 programs each. Let�s also assume that the mailing receives a 0.5% response. The response could be much better. Also, many people will email out hundreds of thousands of programs instead of 2,000. (Why stop at 2000?). But continuing with this example, you send out only 2,000 programs. With a 0.5% response, that is

only 10 orders for

REPORT #1. Those 10 people respond by sending out 2,000 programs each for a total of 20,000. Out of those 0.5% 100 people respond and order

REPORT #2. Those 100 mail out 2,000 programs each for a total of 200,000. The 0.5% response to that is 1,000 orders for

REPORT #3. Those 1,000 send out 2,000 programs each for a 2,000,000 total. The 0.5% response to that is 10,000 orders for

REPORT #4. That�s 10,000 $5 bills for you. CASH!!!

Your total income in this example is $50 + $500 + $5,000 + $50,000 for a

total of $55,550!!!

REMEMBER FRIEND, THIS IS ASSUMING 1,990 OUT OF THE 2,000 PEOPLE YOU MAIL TO WILL DO ABSOLUTELY NOTHING AND TRASH THIS PROGRAM! DARE TO THINK FOR A MOMENT WHAT WOULD HAPPEN IF EVERYONE, OR HALF SENT OUT 100,000 PROGRAMS INSTEAD OF 2,000. Believe me, many people will do just that, and more!

METHOD #2: PLACING FREE ADS ON THE INTERNET
Advertising on the internet is very, very inexpensive, and there are HUNDREDS of FREE places to advertise. Let�s say you decide to start small just to see how well it works. Assume your goal is to get ONLY 10 people to participate on your first level. (Placing a lot of FREE ads on

the Internet will EASILY get a larger response.) Also assume that everyone else in YOUR ORGANIZATION gets ONLY 10 downline members. Look how this small number accumulates to achieve the STAGGERING results

below:

1st level--your first 10 send you $5................................$50
2nd level--10 members from those 10 ($5 x 100).............$500
3rd level--10 members from those 100 ($5 x 1000)........$5,000
4th level--10 members from those 1000 ($5 x 10,000)..$50,000

$$$$$$ THIS TOTALS ----------$55,550 $$$$$$

AMAZING ISN�T IT? Remember friends, this assumes that the people who participate only recruit 10 people each. Think for a moment what would happen if they got 20 people to participate! Most people get 100�s

of
participants and many will continue to work this program, sending
out programs WITH YOUR NAME ON THEM for years! THINK ABOUT IT!

~~~~~~

People are going to get emails about this plan from you or somebody else
and
many will work this plan. The question is, don�t you want your
name to be on the emails they will send out?

* * * DON�T MISS OUT!!! * * * JUST TRY IT ONCE!!! * * *

* * SEE WHAT HAPPENS!!! *** YOU�LL BE AMAZED!!!* *

~~~~~~

ALWAYS PROVIDE SAME-DAY SERVICE ON ALL ORDERS!

This will guarantee that the e-mail THEY send out with YOUR name and
address
on it will be prompt because they can�t advertise until they
receive the report!

~~~~~~

GET STARTED TODAY: PLACE YOUR ORDER FOR THE FOUR REPORTS NOW.

Notes: ALWAYS SEND $5 CASH (U.S. CURRENCY) FOR EACH REPORT. CHECKS NOT
ACCEPTED. Make sure the cash is concealed
by wrapping it in two sheets of paper. On one of those sheets of paper
write:

(a) the number & name of the report you are ordering

(b) your e-mail address, and

(c) your name & postal address.

REPORT #1 "The Insider�s Guide to Advertising for Free on the Internet"

ORDER REPORT #1 FROM:
Andrew Skidmore
9379 Alexander Rd
Alexander, NY 14005
USA

REPORT #2 "The Insider�s Guide to Sending Bulk E-mail on the Internet"

ORDER REPORT #2 FROM:
Lars Pedersen
Skejbygaardsvej 7, 1, 10
8240 Risskov
~~~~~~

Denmark

REPORT #3 "The Secrets to Multilevel Marketing on the Internet"

ORDER REPORT #3 FROM:
John Cole Werner
PO Box 3281
Lihue, HI 96766

REPORT #4 "How to become a Millionaire utilizing the Power of Multilevel

Marketing and the Internet"

ORDER REPORT #4 FROM:
Zac Majors
2242 E Woodchuck Way
Sandy, UT 84093

******* TIPS FOR SUCCESS *******

TREAT THIS AS YOUR BUSINESS! Be prompt, professional, and follow the directions accurately. Send for the four reports IMMEDIATELY so you will have them when the orders start coming in because: When you receive a $5 order, you MUST send out the requested product/report. It is required for this to be a legal business and they need the reports to send out their letters (with your name on them!)

-- ALWAYS PROVIDE SAME-DAY SERVICE ON THE ORDERS YOU RECEIVE. -- Be patient and persistent with this program - If you follow the instructions exactly - results WILL FOLLOW. $$$$

******* YOUR SUCCESS GUIDELINES *******

Follow these guidelines to guarantee your success: If you don�t receive 20 orders for REPORT #1 within two weeks, continue advertising or sending e-mails until you do. Then, a couple of weeks later you should receive at least 100 orders for REPORT #2. If you don�t, continue advertising or sending e-mails until you do. Once you have received 100 or more orders for REPORT #2, YOU CAN RELAX, because the system is already working for you, and the cash will continue to roll in!

THIS IS IMPORTANT TO REMEMBER: Every time your name is moved down on the

list, you are placed in front of a DIFFERENT report. You can KEEP TRACK of your PROGRESS by watching which report people are ordering from you.

To generate more income, simply send another batch of e-mails or

continue
placing ads and start the whole process again! There is no limit to
the income you will generate from this business!

Before you make your decision as to whether or not you participate in
this
program, please answer one question. ARE YOU HAPPY WITH
YOUR PRESENT INCOME OR JOB? If the answer is no, then please look at the

following facts about this super simple MLM program:

1. NO face to face selling, NO meetings, NO inventory! NO Telephone
calls,
NO big cost to start! NOthing to learn, NO skills needed! (Surely
you know how to send email?)

2. No equipment to buy - you already have a computer and internet
connection
- so you have everything you need to fill orders!

3. You are selling a product which does NOT COST ANYTHING TO PRODUCE OR
SHIP! (Emailing copies of the reports is FREE!)

4. All of your customers pay you in CA$H! This program will change your
LIFE FOREVER!! Look at the potential for you to be able to quit your
job and live a life of luxury you could only dream about! Imagine
getting
out of debt and buying the car and home of your dreams and being
able to work a super-high paying leisurely easy business from home!

$$$ FINALLY MAKE SOME DREAMS COME TRUE! $$$

ACT NOW! Take your first step toward achieving financial independence.
Order the reports and follow the program outlined above--
SUCCESS will be your reward.

Thank you for your time and consideration.

PLEASE NOTE: If you need help with starting a business, registering a
business name, learning how income tax is handled, etc., contact your
local office of the Small Business Administration (a Federal Agency) at
1-800-827-5722 for free help and answers to questions.

Also, the Internal Revenue Service offers free help via telephone and
free
seminars about business tax requirements. Your earnings are highly
dependent on your activities and advertising. The information contained
on
this site and in the report constitutes no guarantees stated nor
implied. In the event that it is determined that this site or report
constitutes a guarantee of any kind, that guarantee is now void. The
earnings
amounts listed on this site and in the report are estimates only. If you

have any questions of the legality of this program, contact the Office
of
Associate Director for Marketing Practices, Federal Trade Commission,
Bureau
of Consumer Protection in Washington, DC.

If you need some example sourcecode for rtty, amtor and pactor using
soundcard linux, look at:
http://www.ife.ee.ethz.ch/~sailer/ham/linux/hf.html

Does not compile out of the box on current systems, however. You need to use the userland implementation of hf_kernel and tweak with some assembler code current gcc seem to have problems with.

The DSP part of this is already in the kernel, and accessible via /dev/hfmodem. It can be enabled in the configuration when needed.

I don't know what userprogram supports this device, there is no documentation in the sourcecode... it only says it was written by Thomas Sailer (sailer@ife.ee.ethz.ch).

As far as I know the kernel part will disappear in future linux
version because it is hard to maintain and only supports very
few soundcards. At Thomas' site you find 3 parts: the DSP-stuff
as kernel-land implementation (hfkernel_kernel), the DSP things
for usermode (hfkernel_user) and the terminal itself. You need
either ther usermode hfkernel or the kernelmode hfkernel. The
double meaning of "kernel" is a little confusing in this case...
The usermode kernel uses the standard linux sounddrivers and
should work with current hardware where the hfkernel_kernel
only supports ISA Soundblaster compatible cards with aren't
manufactured any more. You have to apply a patch for glibc2
systems and even then there is a compilation problem with
current gcc which prevented me from playing around with this.
It seems with current gcc you can't access the "%eax" register

from inline assembler anymore. Something like that, tried
it some time ago, forgot the details.

What you are actually seeing is related to Amateur Radio in a general sense.
We don't conduct business on Ham Radio. No commercials, no "cashing in" on
the air, and most certainly no indecency there.

We all know what's on the Internet, and all Hams who have a clue about the
hobby know that 90% or more of what you find there is inappropriate for the
Ham bands. Only a moronic LandLine Lid would have a problem understanding
that, and go on to promote the use of Amateur Radio for casual Internet
access.

I don't think Ham Radio is going to die, but I do see where the "LandLine
Lid" mentality will not last long in the hobby. As more and more Hams come
to understand the fact that LandLine Lids are willing to toss the essential
decency of Ham Radio for the most trivial and self-serving of purposes,
being a "LandLine Lid" takes you further and further beyond the pale. -
Exactly where you belong.

Get a CB radio, if you can't understand or abide common decency. Your kind
has already had their way there. Go where you belong, with all your "good
buddies". No rules! Go for it.

I think you need to re-check what news groups you have selected :-)
I haven't had any porn sent to my email based on participation in this
news group.

I also don't use pre-view in my news or mail reader. If the title looks
even a little bogus I just delete it. I find that subjects that are all caps
usually can be deleted outright. I also use a large filter table, so certain
people and subjects get automatic deletion. Stuff like "help me" or
"MONEY" and "!!!" in the subject line get rid of about 50% of the crapola.

You mean stock prices, literature, technical information, hobby sites,
how-to sites, the Olympics, newspapers, magazines, Sesame Street,
Ty (beanie babies), solar and ionospheric conditions, dictionaries (oh,
wait, they *might* have some *bad* words in them), et al ad nauseum.

Might be some porn somewhere, I've never run across any in my 20+ years
"on the net". Maybe that is because I don't go looking for it ...

> being a "LandLine Lid" takes you further and further beyond the pale. -
> Exactly where you belong.

What any ham station transmits is the responsibility of it's control operator,
with the specific exception for cetain activies involving BBS systems.
i.e. it is up to the individual ham to decide what his radio should transmit.

> Get a CB radio, if you can't understand or abide common decency. Your kind
> has already had their way there. Go where you belong, with all your "good
> buddies". No rules! Go for it.

One person's "common decency" is another person's "censorship".

Ah.. right.

I remember looking at that some time ago, but kinda dismissed
it because I thought it required a modified linux kernel
(I usually stick to "stock" kernels due to extreme lazyness :)

I'll look over the code and see if I can learn some of the tricks
of the trade :)

Hello, I've been guided to this newsgroup for info on APRS.

What I want to do is set up a "marine distress locator" for my final year project.
Which will comprise of many GPS recievers and some method of sending there NMEA data out to my PC.
I found out about APRS but unsure how to incorporate it into this project.

Questions:

1) What does TNC stand for? I understand that it processes NMEA data into information packets.
2) Does a TNC actually transmit the packets ? If not what type of transmitter would I use and how much would it cost.
3) My PC will be used to pick up the APRS, but how? What device do I need? A radio????? What type, and how much will it cost? I have a AR8000 scanner could this be used????
4) Since my Degree is Software Design I will be writing a program to pick up the data recieved by the radio(if this is what is used) what format will this be in? NMEA or APRS?

Thanks for your time and please feel free to give any thoughts.

Regards
Tobias.

Tobias Webster <webtron@thefreeinternet.co.uk> wrote:
>1) What does TNC stand for? I understand that it processes NMEA data into
>information packets.

A TNC is a Terminal Node Controller, a device invented in the eighties
to use a dumb terminal to send packets. It is similar to what an X.25
guru would call a PAD. (Packet Assembler-Disassembler)

But today you don't really need a TNC, there are other simple devices
that are dedicated to the task of sending the NMEA data as a packet.

They are usually very simple PIC-based boards.

>2) Does a TNC actually transmit the packets ? If not what type of
>transmitter would I use and how much would it cost.

No, you need a separate transmitter.
First you need to look at your options w.r.t. licensing. Then you can
decide what frequency to use, how much power, what kind of antenna, etc.
(depending on the range)
This together will determine the cost.

>3) My PC will be used to pick up the APRS, but how? What device do I need? A
>radio????? What type, and how much will it cost? I have a AR8000 scanner
>could this be used????

You need a receiver matching your transmitter (the scanner will probably
be OK in most cases) and a soundcard or an AFSK modem or a TNC.

>4) Since my Degree is Software Design I will be writing a program to pick up
>the data recieved by the radio(if this is what is used) what format will
>this be in? NMEA or APRS?

This depends on what you send. You can send the NMEA data (this is one allowed format of APRS data) or use the more compact APRS formats with conversion between the GPS and transmitter (the PIC-based device will do that, a TNC won't).

On the PC, it all depends on what you want to write. Plug and play solutions are available (all the way from soundcard or modem to the display of a map with moving icons), but you can always ignore part of that and write your own software for that layer.

This can include DSP of the audio, decoding of the raw bits into packets, decoding of the packets to relevant position information, and processing of that information and displaying in the form you like.

Rob

Thank you for proving my point, Steve. Unless you take special precautions
that not every Ham could (or would) employ, you get "crapola" from your
E-mail connection.

Hank is going pretty far to delude himself on this issue, but I can always
depend on you to show the LandLine Lid mindset with total clarity. You back
me up, every time, old pardner.

Thanks again.

Yep, just about anything you can imagine is on the Internet, and more. My
point exactly.

>
> Might be some porn somewhere, I've never run across any in my 20+ years

...And you are utterly certain that nobody else would, either, just because
you don't.

I get unsolicited "porn" offers in my E-mail, and see them on the newsgroups
as well. I've seen them here. Wake up and smell the diharrea, Hank. Get
real.

Banners, commercials, and so on, not to mention the unmentionable stuff. (As if you didn't know)... The Ham bands are not an appropriate place for commercialism (and commercials) . Sorry to hear that after all your years as a Ham, you haven't figured that out yet.

Yes, I agree that promoting the use of Ham Radio for casual Internet access is total nonsense. You can get Internet access that is much less expensive, and that performs much, much better *without* trashing out the Ham bands. There is literally no point to it. Total nonsense, as you say.

> i.e. it is up to the individual ham to decide what his radio should
transmit.

Most (but obviously not ALL) Hams are restrained by consideration of such concepts as common decency, and what's good for the hobby, not to mention the PART97 regs concerning commercialism in connection with Amateur Radio. Only a moronic LandLine Lid tries to find rationalizations for bypassing those considerations for trivial, selfish purposes such as the "total nonsense" idea of using Ham Radio for casual Internet access.

Maybe YOU don't see a problem with porn on the Ham bands, but I think that
by expressing that opinion, you have put yourself beyond the pale. Ham Radio
should be safe for children, Hank. A place where they can go and EXPECT
decency. Wake up and smell the coffee. There are other issues to consider
here that are MUCH more important than misusing the Ham bands for selfish,
trivial purposes.

Charles,

I've been on the internet since before it was the internet.

Anyone who thinks porn is rampant there is simply
going out of their way to look for it.

The internet has a large amount of useful information,
try it out sometime, you might be surprised!

I'm not even "utterly certain" there is no porn on 75 M SSB.

> I get unsolicited "porn" offers in my E-mail, and see them on the newsgroups

You see a different internet than I do.
Guess one finds what one looks for.

This has nothing to do with ham radio, I'm outa here.
